FCC STATEMENT

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:

- 1) This device may not cause harmful interference.
- 2) This device must accept any interference received, including interference that may cause undesired operation.

Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

CE Mark Warning

This is a class A product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

Продукт сертифіковано згідно с правилами системи УкрСЕПРО на відповідність вимогам нормативних документів та вимогам, що передбачені чинними законодавчими актами України.

Safety Information

- When product has power button, the power button is one of the way to shut off the product; When there is no power button, the only way to completely shut off power is to disconnect the product or the power adapter from the power source.
- Don't disassemble the product, or make repairs yourself. You run the risk of electric shock and voiding the limited warranty. If you need service, please contact us.
- Avoid water and wet locations.

This product can be used in the following countries:

AT	BG	BY	CA	CZ	DE	DK	EE
ES	FI	FR	GB	GR	HU	IE	IT
LT	LV	MT	NL	NO	PL	PT	RO

Package Contents

The following items should be found in your box:

- One TL-SL5428E switch
- One power cord
- One console cable
- Two mounting brackets and other fittings
- Installation Guide
- Resource CD for TL-SL5428E switch, including:
 - This User Guide
 - Other Helpful Information

Note:

Make sure that the package contains the above items. If any of the listed items are damaged or missing, please contact your distributor.

Chapter 1 About This Guide

This User Guide contains information for setup and management of TL-SL5428E switch. Please read this guide carefully before operation.

1.1 Intended Readers

This Guide is intended for network managers familiar with IT concepts and network terminologies.

1.2 Conventions

In this Guide the following conventions are used:

- The switch or TL-SL5428E mentioned in this Guide stands for TL-SL5428E 24-Port 10/100Mbps + 4-Port Gigabit JetStream L2 Managed Switch without any explanation.
- **Menu Name**→**Submenu Name**→**Tab page** indicates the menu structure. **System**→**System Info**→**System Summary** means the System Summary page under the System Info menu option that is located under the System menu.
- **Bold font** indicates a button, a toolbar icon, menu or menu item.

Symbols in this Guide:

Symbol	Description
 Note:	Ignoring this type of note might result in a malfunction or damage to the device.
 Tips:	This format indicates important information that helps you make better use of your device.

1.3 Overview of This Guide

Chapter	Introduction
Chapter 1 About This Guide	Introduces the guide structure and conventions.
Chapter 2 Introduction	Introduces the features, application and appearance of TL-SL5428E switch.
Chapter 3 Login to the switch	Introduces how to log on to TL-SL5428E Web management page.

Chapter	Introduction
Chapter 4 System	<p>This module is used to configure system properties of the switch. Here mainly introduces:</p> <ul style="list-style-type: none"> ● System Info: Configure the description, system time and network parameters of the switch. ● User Management: Configure the user name and password for users to log on to the Web management page with a certain access level. ● System Tools: Manage the configuration file of the switch. ● Access Security: Provide different security measures for the login to enhance the configuration management security.
Chapter 5 Switching	<p>This module is used to configure basic functions of the switch. Here mainly introduces:</p> <ul style="list-style-type: none"> ● Port: Configure the basic features for the port. ● LAG: Configure Link Aggregation Group. LAG is to combine a number of ports together to make a single high-bandwidth data path. ● Traffic Monitor: Monitor the traffic of each port ● MAC Address: Configure the address table of the switch.
Chapter 6 VLAN	<p>This module is used to configure VLANs to control broadcast in LANs. Here mainly introduces:</p> <ul style="list-style-type: none"> ● 802.1Q VLAN: Configure port-based VLAN. ● MAC VLAN: Configure MAC-based VLAN without changing the 802.1Q VLAN configuration. ● Protocol VLAN: Create VLANs in application layer to make some special data transmitted in the specified VLAN. ● VLAN VPN: VLAN VPN allows the packets with VLAN tags of private networks to be encapsulated with VLAN tags of public networks at the network access terminal of the Internet Service Provider. ● GVRP: GVRP allows the switch to automatically add or remove the VLANs via the dynamic VLAN registration information and propagate the local VLAN registration information to other switches, without having to individually configure each VLAN. ● Private VLAN: Designed to save VLAN resources of uplink devices and decrease broadcast. Private VLAN mainly used in campus or enterprise networks to achieve user layer-2-separation and to save VLAN resources of uplink devices.
Chapter 7 Spanning Tree	<p>This module is used to configure spanning tree function of the switch. Here mainly introduces:</p> <ul style="list-style-type: none"> ● STP Config: Configure and view the global settings of spanning tree function. ● Port Config: Configure CIST parameters of ports. ● MSTP Instance: Configure MSTP instances. ● STP Security: Configure protection function to prevent devices from any malicious attack against STP features.

Chapter	Introduction
Chapter 8 Multicast	<p>This module is used to configure multicast function of the switch. Here mainly introduces:</p> <ul style="list-style-type: none"> ● IGMP Snooping: Configure global parameters of IGMP Snooping function, port properties, VLAN and multicast VLAN. ● Multicast IP: Configure multicast IP table. ● Multicast Filter: Configure multicast filter feature to restrict users ordering multicast programs. ● Packet Statistics: View the multicast data traffic on each port of the switch, which facilitates you to monitor the IGMP messages in the network. ● Querier: Configure the switch to act as an IGMP Snooping Querier.
Chapter 9 QoS	<p>This module is used to configure QoS function to provide different quality of service for various network applications and requirements. Here mainly introduces:</p> <ul style="list-style-type: none"> ● DiffServ: Configure priorities, port priority, 802.1P priority and DSCP priority. ● Bandwidth Control: Configure rate limit feature to control the traffic rate on each port; configure storm control feature to filter broadcast, multicast and UL frame in the network. ● Voice VLAN: Configure voice VLAN to transmit voice data stream within the specified VLAN so as to ensure the transmission priority of voice data stream and voice quality.
Chapter 10 ACL	<p>This module is used to configure match rules and process policies of packets to filter packets in order to control the access of the illegal users to the network. Here mainly introduces:</p> <ul style="list-style-type: none"> ● Time-Range: Configure the effective time for ACL rules. ● ACL Config: ACL rules. ● Policy Config: Configure operation policies. ● Policy Binding: Bind the policy to a port/VLAN to take its effect on a specific port/VLAN.
Chapter 11 Network Security	<p>This module is used to configure the multiple protection measures for the network security. Here mainly introduces:</p> <ul style="list-style-type: none"> ● IP-MAC Binding: Bind the IP address, MAC address, VLAN ID and the connected Port number of the Host together. ● ARP Inspection: Configure ARP inspection feature to prevent the network from ARP attacks. ● IP Source Guard: Configure IP source guard feature to filter IP packets in the LAN. ● DoS Defend: Configure DoS defend feature to prevent DoS attack. ● 802.1X: Configure common access control mechanism for LAN ports to solve mainly authentication and security problems.

Chapter	Introduction
Chapter 12 SNMP	<p>This module is used to configure SNMP function to provide a management frame to monitor and maintain the network devices. Here mainly introduces:</p> <ul style="list-style-type: none"> ● SNMP Config: Configure global settings of SNMP function. ● Notification: Configure notification function for the management station to monitor and process the events. ● RMON: Configure RMON function to monitor network more efficiently.
Chapter 13 LLDP	<p>This module is used to configure LLDP function to provide information for SNMP applications to simplify troubleshooting. Here mainly introduces:</p> <ul style="list-style-type: none"> ● Basic Config: Configure the LLDP parameters of the device. ● Device Info: View the LLDP information of the local device and its neighbors ● Device Statistics: View the LLDP statistics of the local device
Chapter 14 Cluster	<p>This module is used to configure cluster function to central manage the scattered devices in the network. Here mainly introduces:</p> <ul style="list-style-type: none"> ● NDP: Configure NDP function to get the information of the directly connected neighbor devices. ● NTDP: Configure NTDP function for the commander switch to collect NDP information. ● Cluster: Configure cluster function to establish and maintain cluster. ● Batch Management: Enables you to manage the switches in cluster.
Chapter 15 Maintenance	<p>This module is used to assemble the commonly used system tools to manage the switch. Here mainly introduces:</p> <ul style="list-style-type: none"> ● System Monitor: Monitor the memory and CPU of the switch. ● Log: View configuration parameters on the switch. ● Network Diagnostics: Including Cable Test and Loopback. Cable Test tests the connection status of the cable connected to the switch; and Loopback tests if the port of the switch and the connected device are available. ● Network Diagnostics: Test if the destination is reachable and the account of router hops from the switch to the destination.
Chapter 16 System Maintenance via FTP	Introduces how to download firmware of the switch via FTP function.
Appendix A Specifications	Lists the glossary used in this manual.
Appendix B Configure the PCs	Introduces how to configure the PCs.
Appendix C 802.1X Client Software	Introduces how to use 802.1X Client Software provided for authentication.
Appendix D Glossary	Lists the glossary used in this manual.

Chapter 2 Introduction

Thanks for choosing the TL-SL5428E 24-Port 10/100Mbps + 4-Port Gigabit JetStream L2 Managed Switch!

2.1 Overview of the Switch

Designed for workgroups and departments, TL-SL5428E from TP-LINK provides wire-speed performance and full set of layer 2 management features. It provides a variety of service features and multiple powerful functions with high security.

The EIA-standardized framework and smart configuration capacity can provide flexible solutions for a variable scale of networks. ACL, 802.1x, IP Source Guard and Dynamic ARP Inspection provide robust security strategy. QoS and IGMP snooping/filtering optimize voice and video application. Link aggregation (LACP) increases aggregated bandwidth, optimizing the transport of business critical data. SNMP, RMON, WEB/CLI/Telnet Log-in bring abundant management policies. TL-SL5428E switch integrates multiple functions with excellent performance, and is friendly to manage, which can fully meet the need of the users demanding higher networking performance.

2.2 Main Features

- **Resiliency and Availability**

- + Link aggregation (LACP) increases aggregated bandwidth, optimizing the transport of business critical data.
- + IEEE 802.1s Multiple Spanning Tree provides high link availability in multiple VLAN environments.
- + Multicast snooping automatically prevents flooding of IP multicast traffic.
- + Root Guard protects root bridge from malicious attack or configuration mistakes

- **Layer 2 Switching**

- + GVRP (GARP VLAN Registration Protocol) allows automatic learning and dynamic assignment of VLANs.
- + Supports up to 4K VLANs simultaneously (out of 4K VLAN IDs)

- **Quality of Service**

- + Supports L2/L3 granular CoS with 4 priority queues per port.
- + Rate limiting confines the traffic flow accurately according to the preset value.

- **Security**

- + Supports multiple industry standard user authentication methods such as 802.1x, RADIUS.
- + IP Source Guard prevents IP spoofing attacks.
- + Dynamic ARP Inspection blocks ARP packets from unauthorized hosts, preventing man-in-the-middle attacks.
- + L2/L3/L4 Access Control Lists restrict untrusted access to the protected resource.
- + Provides SSHv1/v2, SSL 2.0/3.0 and TLS v1 for access encryption.

- **Manageability**

- + IP Clustering provides high scalability and easy Single-IP-Management.
- + Supports Telnet, CLI, SNMP v1/v2c/v3, RMON and web access.
- + Port Mirroring enables monitoring selected ingress/egress traffic.

2.3 Appearance Description

2.3.1 Front Panel

Figure 2-1 Front Panel

The following parts are located on the front panel of the switch:

- **10/100Mbps RJ45 Ports:** Designed to connect to a device with the bandwidth of 10Mbps or 100Mbps. Each has a corresponding 10/100Mbps LED.
- **10/100/1000Mbps RJ45 Ports:** Designed to connect to a device with the bandwidth of 10Mbps, 100Mbps or 1000Mbps. Each has a corresponding 1000Mbps LED.
- **SFP Ports:** Designed to install the SFP module. Port 27F shares the same LED with Port 27T and Port 28F shares the same LED with Port 28T.
- **Console Port:** Designed to connect with the serial port of a computer or terminal for monitoring and configuring the switch.
- **LEDs**

Name	Status	Indication
PWR	On	Power is on.
	Flashing	Power supply is abnormal.
	Off	Power is off or power supply is abnormal.
SYS	On	The switch is working abnormally.
	Flashing	The switch is working normally.
	Off	The switch is working abnormally.
10/100Mbps	On	A device is linked to the corresponding port.
	Flashing	Data is being transmitted or received.
	Green	The linked device is running at 100Mbps.
	Yellow	The linked device is running at 10Mbps.
1000Mbps	On	A device is linked to the corresponding port.
	Flashing	Data is being transmitted or received.
	Green	The linked device is running at 1000Mbps.
	Yellow	The linked device is running at 10/100Mbps.

2.3.2 Rear Panel

The rear panel of TL-SL5428E features a power socket and a Grounding Terminal (marked with⊕).

Figure 2-2 Rear Panel

- **Grounding Terminal:** TL-SL5428E already comes with Lightning Protection Mechanism. You can also ground the switch through the PE (Protecting Earth) cable of AC cord or with Ground Cable. For detail information, please refer to Installation Guide.
- **AC Power Socket:** Connect the female connector of the power cord here, and the male connector to the AC power outlet. Please make sure the voltage of the power supply meets the requirement of the input voltage (100-240V~ 50/60Hz 0.6A).

[Return to CONTENTS](#)

Chapter 3 Login to the Switch

3.1 Login

- 1) To access the configuration utility, open a web-browser and type in the default address `http://192.168.0.1` in the address field of the browser, then press the **Enter** key.

Figure 3-1 Web-browser

Tips:

To log in to the switch, the IP address of your PC should be set in the same subnet addresses of the switch. The IP address is 192.168.0.x ("x" is any number from 2 to 254), Subnet Mask is 255.255.255.0. For the detailed instructions as to how to do this, please refer to Appendix B.

- 2) After a moment, a login window will appear, as shown in Figure 3-2. Enter **admin** for the User Name and Password, both in lower case letters. Then click the **Login** button or press the **Enter** key.

A screenshot of the TP-LINK login page. At the top is a dark blue header with the 'TP-LINK' logo in white. Below the header is a light blue background. In the center, there are two input fields: 'User Name:' with 'admin' entered, and 'Password:' with six black dots. Below these fields are two buttons: 'Login' and 'Clear'.

Figure 3-2 Login

3.2 Configuration

After a successful login, the main page will appear as Figure 3-3, and you can configure the function by clicking the setup menu on the left side of the screen.

System Info

System Description:	24-Port 10/100Mbps + 4-Port Gigabit L2 Managed Switch
Device Name:	TL-SL5428E
Device Location:	SHENZHEN
System Contact:	www.tp-link.com
Hardware Version:	TL-SL5428E 2.0
Firmware Version:	2.8.4 Build 20121211 Rel.43093
IP Address:	192.168.0.1
Subnet Mask:	255.255.255.0
Default Gateway:	
MAC Address:	00-0A-EB-00-13-01
System Time:	2006-01-01 08:00:34
Run Time:	0 day - 0 hour - 0 min - 47 sec

Refresh Help

Figure 3-3 Main Setup-Menu

Note:

Clicking **Apply** can only make the new configurations effective before the switch is rebooted. If you want to keep the configurations effective even the switch is rebooted, please click **Save Config**. You are suggested to click **Save Config** before cutting off the power or rebooting the switch to avoid losing the new configurations.

Chapter 4 System

The System module is mainly for system configuration of the switch, including four submenus: **System Info**, **User Management**, **System Tools** and **Access Security**.

4.1 System Info

The System Info, mainly for basic properties configuration, can be implemented on **System Summary**, **Device Description**, **System Time**, **Daylight Saving Time** and **System IP** pages.

4.1.1 System Summary

On this page you can view the port connection status and the system information.

The port status diagram shows the working status of 24 10/100Mbps RJ45 ports, 4 10/100/1000Mbps RJ45 ports and 2 SFP ports of the switch. Ports 1 to 24 are 10/100Mbps ports. Ports 25-26 and 27T-28T are 10/100/1000Mbps ports, among which ports 27T and 28T are Combo ports with SFP ports labeled 27F and 28F.

Choose the menu **System**→**System Info**→**System Summary** to load the following page.

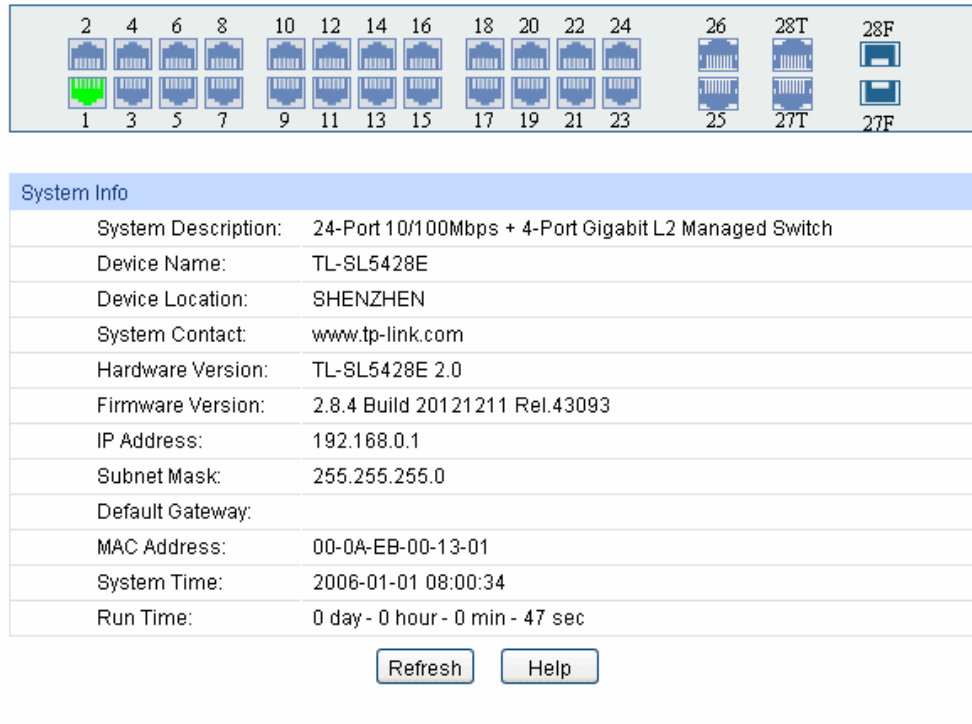

Figure 4-1 System Summary

➤ Port Status

Indicates the 100Mbps port is not connected to a device.

Indicates the 100Mbps port is at the speed of 100Mbps.

Indicates the 100Mbps port is at the speed of 10Mbps.

Indicates the 1000Mbps port is not connected to a device.

Indicates the 1000Mbps port is at the speed of 1000Mbps.

Indicates the 100Mbps port is at the speed of 10Mbps or 100Mbps.

Indicates the SFP port is not connected to a device.

Indicates the SFP port is at the speed of 1000Mbps.

Indicates the SFP port is at the speed of 100Mbps.

When the cursor moves on the port, the detailed information of the port will be displayed.

Figure 4-2 Port Information

➤ **Port Info**

Port: Displays the port number of the switch.

Type: Displays the type of the port.

Rate: Displays the maximum transmission rate of the port.

Status: Displays the connection status of the port.

Click a port to display the bandwidth utilization on this port. The actual rate divided by theoretical maximum rate is the bandwidth utilization. Figure 4-3 displays the bandwidth utilization monitored every four seconds. Monitoring the bandwidth utilization on each port facilitates you to monitor the network traffic and analyze the network abnormalities.

Figure 4-3 Bandwidth Utilization

➤ **Bandwidth Utilization**

Rx: Select Rx to display the bandwidth utilization of receiving packets on this port.

Tx: Select Tx to display the bandwidth utilization of sending packets on this port.

4.1.2 Device Description

On this page you can configure the description of the switch, including device name, device location and system contact.

Choose the menu **System**→**System Info**→**Device Description** to load the following page.

Device Description

Device Name:

Device Location:

System Contact:

Note:

The Device Name, Location and Contact should be not more than 32 characters.

Figure 4-4 Device Description

The following entries are displayed on this screen:

➤ **Device Description**

- Device Name:** Enter the name of the switch.
- Device Location:** Enter the location of the switch.
- System Contact:** Enter your contact information.

4.1.3 System Time

System Time is the time displayed while the switch is running. On this page you can configure the system time and the settings here will be used for other time-based functions like ACL.

You can manually set the system time, get UTC automatically if it has connected to an NTP server or synchronize with PC's clock as the system time.

Choose the menu **System**→**System Info**→**System Time** to load the following page.

Time Info

Current System Date: 2006-01-01 08:15:09 Sunday

Current Time Source: Manual

Time Config

Manual

Date:

Time:

Get Time from NTP Server

Time Zone:

Primary Sever:

Secondary Sever:

Update Rate: hour(s)

Synchronize with PC's Clock

Figure 4-5 System Time

The following entries are displayed on this screen:

➤ **Time Info**

Current System Date: Displays the current date and time of the switch.

Current Time Source: Displays the current time source of the switch.

➤ **Time Config**

Manual: When this option is selected, you can set the date and time manually.

Get Time from NTP Server: When this option is selected, you can configure the time zone and the IP Address for the NTP Server. The switch will get UTC automatically if it has connected to an NTP Server.

- **Time Zone:** Select your local time.
- **Primary/Secondary NTP Server:** Enter the IP Address for the NTP Server.
- **Update Rate:** Specify the rate fetching time from NTP server.

Synchronize with PC'S Clock: When this option is selected, the administrator PC's clock is utilized.

Note:

1. The system time will be restored to the default when the switch is restarted and you need to reconfigure the system time of the switch.
2. When Get Time from NTP Server is selected and no time server is configured, the switch will get time from the time server of the Internet if it has connected to the Internet.

4.1.4 Daylight Saving Time

Here you can configure the Daylight Saving Time of the switch.

Choose the menu **System**→**System Info**→**Daylight Saving Time** to load the following page.

DST Config

DST Status:

Predefined Mode

USA Australia Europe New Zealand

Recurring Mode

Offset: (minutes)

Start Time: Week Day Month

End Time: Week Day Month

Date Mode

Offset: (minutes)

Start Time: (MM/DD HH:MM)

End Time: (MM/DD HH:MM)

Figure 4-6 Daylight Saving Time

The following entries are displayed on this screen:

➤ **DST Config**

- DST Status:** Enable or Disable DST.
- Predefined Mode:** Select a predefined DST configuration:
- USA: Second Sunday in March, 02:00 ~ First Sunday in November, 02:00.
 - Australia: First Sunday in October, 02:00 ~ First Sunday in April, 03:00.
 - Europe: Last Sunday in March, 01:00 ~ Last Sunday in October, 01:00.
 - New Zealand: Last Sunday in September, 02:00 ~ First Sunday in April, 03:00.
- Recurring Mode:** Specify the DST configuration in recurring mode. This configuration is recurring in use:
- Offset: Specify the time adding in minutes when Daylight Saving Time comes.
 - Start/End Time: Select starting time and ending time of Daylight Saving Time.
- Date Mode:** Specify the DST configuration in Date mode. This configuration is one-off in use:
- Offset: Specify the time adding in minutes when Daylight Saving Time comes.
 - Start/End Time: Select starting time and ending time of Daylight Saving Time.

Note:

1. When the DST is disabled, the predefined mode, recurring mode and date mode cannot be configured.
2. When the DST is enabled, the default daylight saving time is of Europe in predefined mode.

4.1.5 System IP

Each device in the network possesses a unique IP Address. You can log on to the Web management page to operate the switch using this IP Address. The switch supports three modes to obtain an IP address: Static IP, DHCP and BOOTP. The IP address obtained using a new mode will replace the original IP address. On this page you can configure the system IP of the switch.

Choose the menu **System**→**System Info**→**System IP** to load the following page.

IP Config

MAC Address: 00-00-54-28-C0-69

IP Address Mode: Static IP DHCP BOOTP

Management VLAN: (VLAN ID: 1-4094)

IP Address:

Subnet Mask:

Default Gateway:

Note:

Changing IP address to a different IP segment will interrupt the network communication, so please keep the new IP address in the same IP segment with the local network.

Figure 4-7 System IP

The following entries are displayed on this screen:

➤ **IP Config**

MAC Address: Displays MAC Address of the switch.

IP Address Mode: Select the mode to obtain IP Address for the switch.

- **Static IP:** When this option is selected, you should enter IP Address, Subnet Mask and Default Gateway manually.
- **DHCP:** When this option is selected, the switch will obtain network parameters from the DHCP Server.
- **BOOTP:** When this option is selected, the switch will obtain network parameters from the BOOTP Server.

Management VLAN: Enter the ID of management VLAN, the only VLAN through which you can get access to the switch. By default VLAN1 owning all the ports is the Management VLAN and you can access the switch via any port on the switch. However, if another VLAN is created and set to be the Management VLAN, you may have to reconnect the management station to a port that is a member of the Management VLAN.

IP Address: Enter the system IP of the switch. The default system IP is 192.168.0.1 and you can change it appropriate to your needs.

Subnet Mask: Enter the subnet mask of the switch.

Default Gateway: Enter the default gateway of the switch.

Note:

1. Changing the IP address to a different IP segment will interrupt the network communication, so please keep the new IP address in the same IP segment with the local network.
2. The switch only possesses an IP address. The IP address configured will replace the original IP address.
3. If the switch gets the IP address from DHCP server, you can see the configuration of the switch in the DHCP server; if DHCP option is selected but no DHCP server exists in the network, the switch will keep obtaining IP address from DHCP server until success.
4. If DHCP or BOOTP option is selected, the switch will get network parameters dynamically from the Internet, which means that its IP address, subnet mask and default gateway can not be configured.

5. By default, the IP address is 192.168.0.1.

4.2 User Management

User Management functions to configure the user name and password for users to log on to the Web management page with a certain access level so as to protect the settings of the switch from being randomly changed.

The User Management function can be implemented on **User Table** and **User Config** pages.

4.2.1 User Table

On this page you can view the information about the current users of the switch.

Choose the menu **System**→**User Management**→**User Table** to load the following page.

User Table			
User ID	User Name	Access Level	Status
1	admin	Admin	Enable

Figure 4-8 User Table

4.2.2 User Config

On this page you can configure the access level of the user to log on to the Web management page. The switch provides two access levels: Guest and Admin. The guest only can view the settings without the right to configure the switch; the admin can configure all the functions of the switch. The Web management pages contained in this guide are subject to the admin's login without any explanation.

Choose the menu **System**→**User Management**→**User Config** to load the following page.

User Info					
User Name:	<input type="text"/>				
Access Level:	<input type="text" value="Guest"/>				
User Status:	<input checked="" type="radio"/> Enable <input type="radio"/> Disable			<input type="button" value="Create"/>	<input type="button" value="Clear"/>
Password:	<input type="text"/>				
Confirm Password:	<input type="text"/>				

User Table					
Select	User ID	User Name	Access Level	Status	Operation
<input type="checkbox"/>	1	admin	Admin	Enable	Edit

Note:

The User Name and Password should be less than 16 characters using digits, English letters and underdashes only.

Figure 4-9 User Config

The following entries are displayed on this screen:

➤ **User Info**

- User Name:** Create a name for users' login.
- Access Level:** Select the access level to login.
- **Admin:** Admin can edit, modify and view all the settings of different functions.
 - **Guest:** Guest only can view the settings without the right to edit and modify.
- User Status:** Select Enable/Disable the user configuration.
- Password:** Type a password for users' login.
- Confirm Password:** Retype the password.

➤ **User Table**

- Select:** Select the desired entry to delete the corresponding user information. It is multi-optional. The current user information can't be deleted.
- User ID, Name, Access Level and status:** Displays the current user ID, user name, access level and user status.
- Operation:** Click the **Edit** button of the desired entry, and you can edit the corresponding user information. After modifying the settings, please click the **Modify** button to make the modification effective. Access level and user status of the current user information can't be modified.

4.3 System Tools

The System Tools function, allowing you to manage the configuration file of the switch, can be implemented on **Config Restore**, **Config Backup**, **Firmware Upgrade**, **System Reboot** and **System Reset** pages.

4.3.1 Config Restore

On this page you can upload a backup configuration file to restore your switch to this previous configuration.

Choose the menu **System**→**System Tools**→**Config Restore** to load the following page.

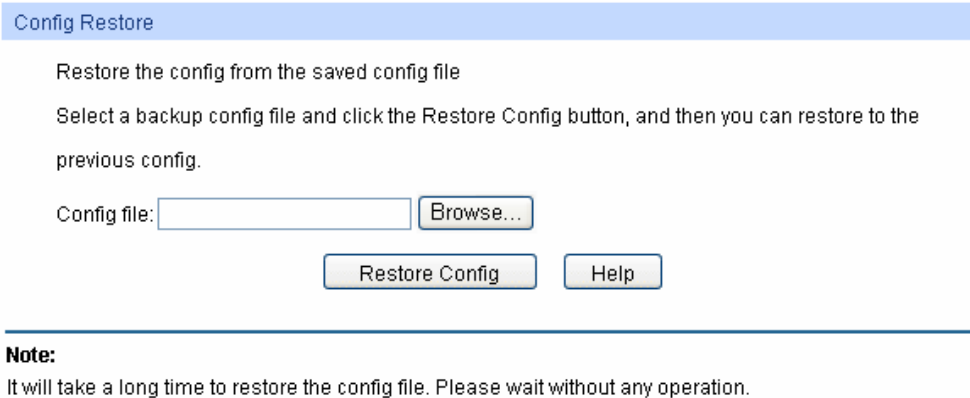

Figure 4-10 Config Restore

The following entries are displayed on this screen:

➤ **Config Restore**

Restore Config: Click the **Restore Config** button to restore the backup configuration file. It will take effect after the switch automatically reboots.

 **Note:**

1. It will take a few minutes to restore the configuration. Please wait without any operation.
2. To avoid any damage, please don't power down the switch while being restored.
3. After being restored, the current settings of the switch will be lost. Wrong uploaded configuration file may cause the switch unmanaged.

4.3.2 Config Backup

On this page you can download the current configuration and save it as a file to your computer for your future configuration restore.

Choose the menu **System**→**System Tools**→**Config Backup** to load the following page.

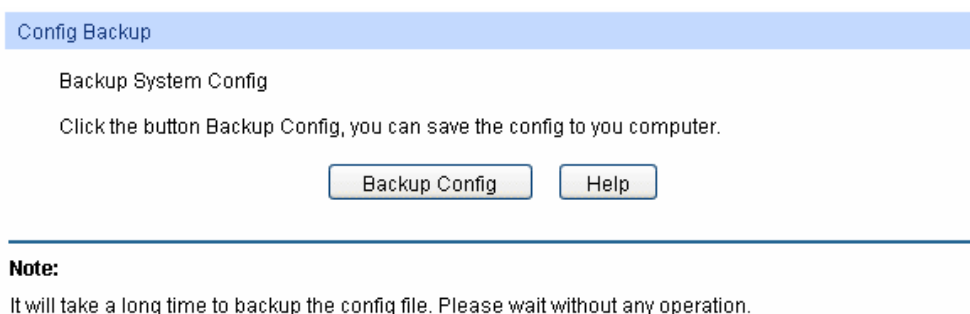

Figure 4-11 Config Backup

The following entries are displayed on this screen:

➤ **Config Backup**

Backup Config: Click the Backup Config button to save the current configuration as a file to your computer. You are suggested to take this measure before upgrading.

Note:

It will take a few minutes to backup the configuration. Please wait without any operation.

4.3.3 Firmware Upgrade

The switch system can be upgraded via the Web management page. To upgrade the system is to get more functions and better performance. Go to <http://www.tp-link.com> to download the updated firmware.

Choose the menu **System**→**System Tools**→**Firmware Upgrade** to load the following page.

Firmware Upgrade

You will get the new function after upgrading the firmware.

Firmware File: Browse... Upgrade Help

Firmware Version: 2.8.1 Build 20120831 Rel.37039

Hardware Version: TL-SL5428E 2.0

Note:

1. Please select the proper software version matching with your hardware to upgrade.
2. To avoid damage, please don't turn off the device while upgrading.
3. After upgrading, the device will reboot automatically.
4. You are suggested to backup the configuration before upgrading.

Figure 4-12 Firmware Upgrade

Note:

1. Don't interrupt the upgrade.
2. Please select the proper software version matching with your hardware to upgrade.
3. To avoid damage, please don't turn off the device while upgrading.
4. After upgrading, the device will reboot automatically.
5. You are suggested to backup the configuration before upgrading.

4.3.4 System Reboot

On this page you can reboot the switch and return to the login page. Please save the current configuration before rebooting to avoid losing the configuration unsaved

Choose the menu **System**→**System Tools**→**System Reboot** to load the following page.

System Reboot

Save Config:

Reboot: Reboot

Note:

To avoid damage, please don't turn off the device while rebooting.

Figure 4-13 System Reboot

Note:

To avoid damage, please don't turn off the device while rebooting.

4.3.5 System Reset

On this page you can reset the switch to the default. All the settings will be cleared after the switch is reset.

Choose the menu **System**→**System Tools**→**System Reset** to load the following page.

Figure 4-14 System Reset

Note:

After the system is reset, the switch will be reset to the default and all the settings will be cleared.

4.4 Access Security

Access Security provides different security measures for the remote login so as to enhance the configuration management security. It can be implemented on **Access Control**, **SSL Config** and **SSH Config** pages.

4.4.1 Access Control

On this page you can control the users logging on to the Web management page to enhance the configuration management security. The definitions of Admin and Guest refer to [4.2 User Management](#).

Choose the menu **System**→**Access Security**→**Access Control** to load the following page.

Access Control Config

Control Mode:

IP Address: Mask:

MAC Address:

Port:

<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4	<input type="checkbox"/> 5	<input type="checkbox"/> 6	<input type="checkbox"/> 7	<input type="checkbox"/> 8
<input type="checkbox"/> 9	<input type="checkbox"/> 10	<input type="checkbox"/> 11	<input type="checkbox"/> 12	<input type="checkbox"/> 13	<input type="checkbox"/> 14	<input type="checkbox"/> 15	<input type="checkbox"/> 16
<input type="checkbox"/> 17	<input type="checkbox"/> 18	<input type="checkbox"/> 19	<input type="checkbox"/> 20	<input type="checkbox"/> 21	<input type="checkbox"/> 22	<input type="checkbox"/> 23	<input type="checkbox"/> 24
<input type="checkbox"/> 25	<input type="checkbox"/> 26	<input type="checkbox"/> 27	<input type="checkbox"/> 28				

Session Config

Session Timeout: min (5-30)

Access User Number

Number Control: Enable Disable

Admin Number: (1-16)

Guest Number: (0-15)

Figure 4-15 Access Control

The following entries are displayed on this screen:

➤ **Access Control Config**

Control Mode: Select the control mode for users to log on to the Web management page.

- **IP-based:** Select this option to limit the IP-range of the users for login.
- **MAC-based:** Select this option to limit the MAC Address of the users for login.
- **Port-based:** Select this option to limit the ports for login.

IP Address&Mask: These fields can be available for configuration only when IP-based mode is selected. Only the users within the IP-range you set here are allowed for login.

MAC Address: The field can be available for configuration only when MAC-based mode is selected. Only the user with this MAC Address you set here is allowed for login.

Port: The field can be available for configuration only when Port-based mode is selected. Only the users connected to these ports you set here are allowed for login.

➤ **Session Config**

Session Timeout: If you do nothing with the Web management page within the timeout time, the system will log out automatically. If you want to reconfigure, please login again.

➤ **Access User Number**

- Number Control;** Select Enable/Disable the Number Control function.
- Admin Number:** Enter the maximum number of the users logging on to the Web management page as Admin.
- Guest Number:** Enter the maximum number of the users logging on to the Web management page as Guest.

4.4.2 SSL Config

SSL (Secure Sockets Layer), a security protocol, is to provide a secure connection for the application layer protocol (e.g. HTTP) communication based on TCP. SSL is widely used to secure the data transmission between the Web browser and servers. It is mainly applied through ecommerce and online banking.

SSL mainly provides the following services:

1. Authenticate the users and the servers based on the certificates to ensure the data are transmitted to the correct users and servers;
2. Encrypt the data transmission to prevent the data being intercepted;
3. Maintain the integrity of the data to prevent the data being altered in the transmission.

Adopting asymmetrical encryption technology, SSL uses key pair to encrypt/decrypt information. A key pair refers to a public key (contained in the certificate) and its corresponding private key. By default the switch has a certificate (self-signed certificate) and a corresponding private key. The Certificate/Key Download function enables the user to replace the default key pair.

After SSL is effective, you can log on to the Web management page via <https://192.168.0.1>. For the first time you use HTTPS connection to log into the switch with the default certificate, you will be prompted that “The security certificate presented by this website was not issued by a trusted certificate authority” or “Certificate Errors”. Please add this certificate to trusted certificates or continue to this website.

On this page you can configure the SSL function.

Choose the menu **System**→**Access Security**→**SSL Config** to load the following page.

The screenshot displays the SSL configuration interface. It is divided into three main sections, each with a light blue header:

- Global Config:** Contains the 'SSL' status, which is currently set to 'Enable' (indicated by a green radio button). There are also 'Disable' and 'Apply' buttons, and a 'Help' button.
- Certificate Download:** Features a 'Certificate File' input field, a 'Browse...' button to select a file, and a 'Download' button.
- Key Download:** Features a 'Key File' input field, a 'Browse...' button to select a file, and a 'Download' button.

Note:

1. The SSL certificate and key downloaded will not take effect until the switch is rebooted.
2. The SSL certificate and key downloaded must match each other; otherwise the HTTPS connection will not work.

Figure 4-16 SSL Config

The following entries are displayed on this screen:

➤ **Global Config**

SSL: Select Enable/Disable the SSL function on the switch.

➤ **Certificate Download**

Certificate File: Select the desired certificate to download to the switch. The certificate must be BASE64 encoded.

➤ **Key Download**

Key File: Select the desired SSL Key to download to the switch. The key must be BASE64 encoded.

Note:

1. The SSL certificate and key downloaded must match each other; otherwise the HTTPS connection will not work.
2. The SSL certificate and key downloaded will not take effect until the switch is rebooted.
3. To establish a secured connection using https, please enter https:// into the URL field of the browser.
4. It may take more time for https connection than that for http connection, because https connection involves authentication, encryption and decryption etc.

4.4.3 SSH Config

As stipulated by IETF (Internet Engineering Task Force), SSH (Secure Shell) is a security protocol established on application and transport layers. SSH-encrypted-connection is similar to a telnet connection, but essentially the old telnet remote management method is not safe, because the password and data transmitted with plain-text can be easily intercepted. SSH can provide information security and powerful authentication when you log on to the switch remotely through an insecure network environment. It can encrypt all the transmission data and prevent the information in a remote management being leaked.

Comprising server and client, SSH has two versions, V1 and V2 which are not compatible with each other. In the communication, SSH server and client can auto-negotiate the SSH version and the encryption algorithm. After getting a successful negotiation, the client sends authentication request to the server for login, and then the two can communicate with each other after successful authentication. This switch supports SSH server and you can log on to the switch via SSH connection using SSH client software.

SSH key can be downloaded into the switch. If the key is successfully downloaded, the certificate authentication will be preferred for SSH access to the switch.

Choose the menu **System**→**Access Security**→**SSH Config** to load the following page.

Global Config

SSH: Enable Disable

Protocol V1: Enable Disable

Protocol V2: Enable Disable

Idle Timeout: sec (1-120)

Max Connect: (1-5)

Key Download

Choose the SSH public key file to download into switch.

Key Type:

Key File:

Note:
It will take a long time to download the key file. Please wait without any operation.

Figure 4-17 SSH Config

The following entries are displayed on this screen:

➤ **Global Config**

- SSH:** Select Enable/Disable SSH function.
- Protocol V1:** Select Enable/Disable SSH V1 to be the supported protocol.
- Protocol V2:** Select Enable/Disable SSH V2 to be the supported protocol.
- Idle Timeout:** Specify the idle timeout time. The system will automatically release the connection when the time is up. The default time is 120 seconds.
- Max Connect:** Specify the maximum number of the connections to the SSH server. No new connection will be established when the number of the connections reaches the maximum number you set. The default value is 5.

➤ **Key Download**

- Key Type:** Select the type of SSH Key to download. The switch supports three types: SSH-1 RSA, SSH-2 RSA and SSH-2 DSA.
- Key File:** Select the desired key file to download.
- Download:** Click the **Download** button to down the desired key file to the switch.

 **Note:**

1. Please ensure the key length of the downloaded file is in the range of 256 to 3072 bits.
2. After the Key File is downloaded, the user's original key of the same type will be replaced. The wrong uploaded file will result in the SSH access to the switch via Password authentication.

Application Example 1 for SSH:

➤ Network Requirements

1. Log on to the switch via password authentication using SSH and the SSH function is enabled on the switch.
2. PuTTY client software is recommended.

➤ Configuration Procedure

1. Open the software to log on to the interface of PuTTY. Enter the IP address of the switch into **Host Name** field; keep the default value 22 in the **Port** field; select SSH as the Connection type.

2. Click the **Open** button in the above figure to log on to the switch. Enter the login user name and password, and then you can continue to configure the switch.

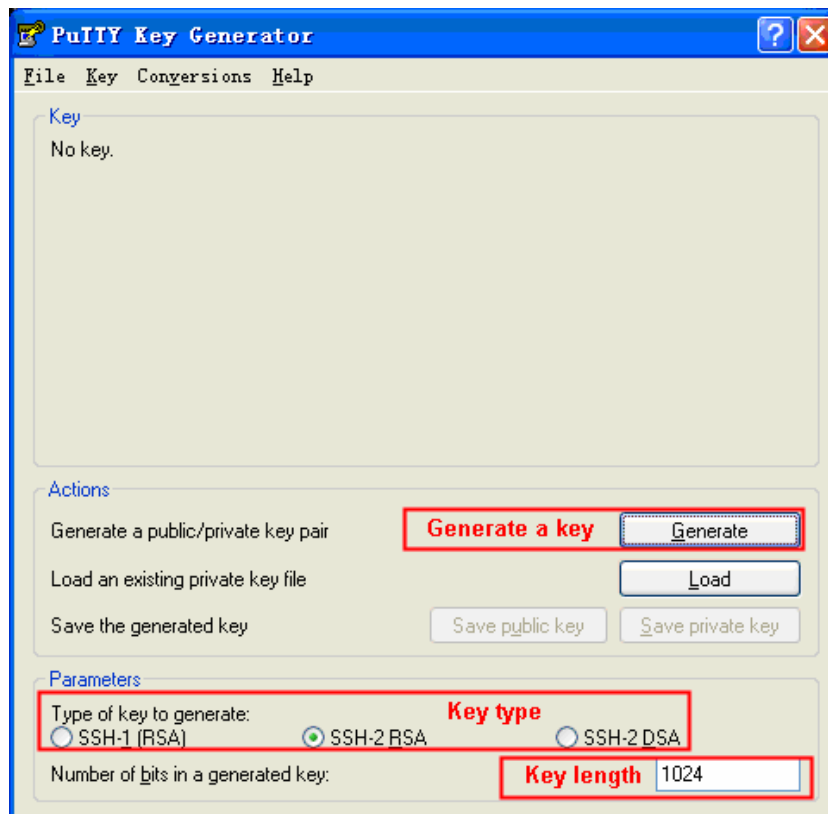

Application Example 2 for SSH:

➤ Network Requirements

1. Log on to the switch via password authentication using SSH and the SSH function is enabled on the switch.
2. PuTTY client software is recommended.

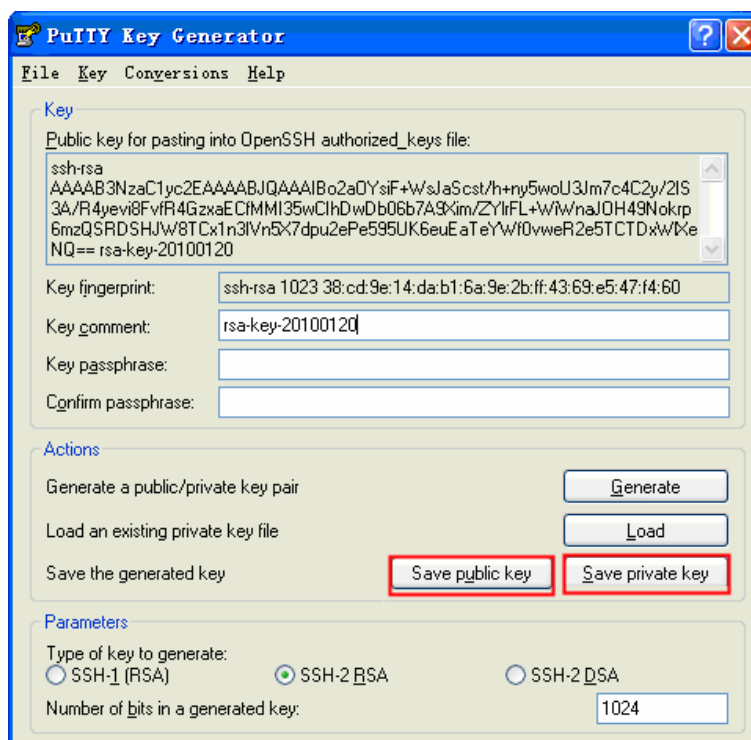

➤ Configuration Procedure

1. Select the key type and key length, and generate SSH key.

Note:

1. The key length is in the range of 256 to 3072 bits.
2. During the key generation, randomly moving the mouse quickly can accelerate the key generation.
2. After the key is successfully generated, please save the public key and private key to the computer.

- On the Web management page of the switch, download the public key file saved in the computer to the switch.

Key Download

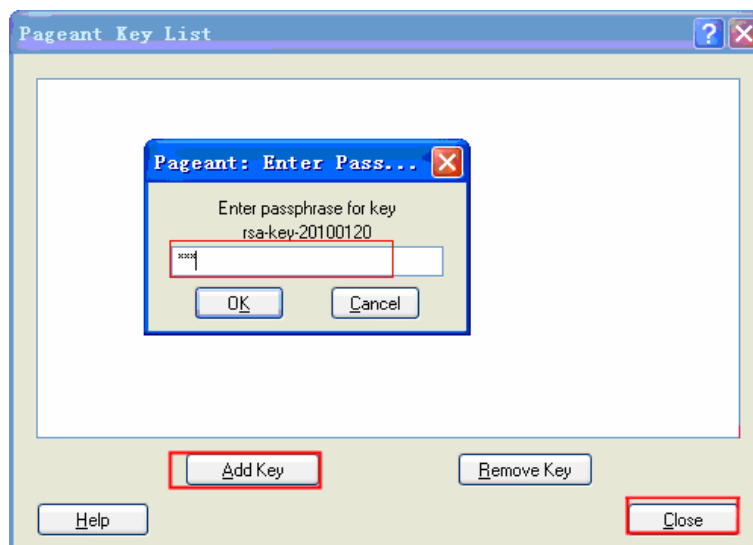

Choose the SSH public key file to download into switch.

Key Type:

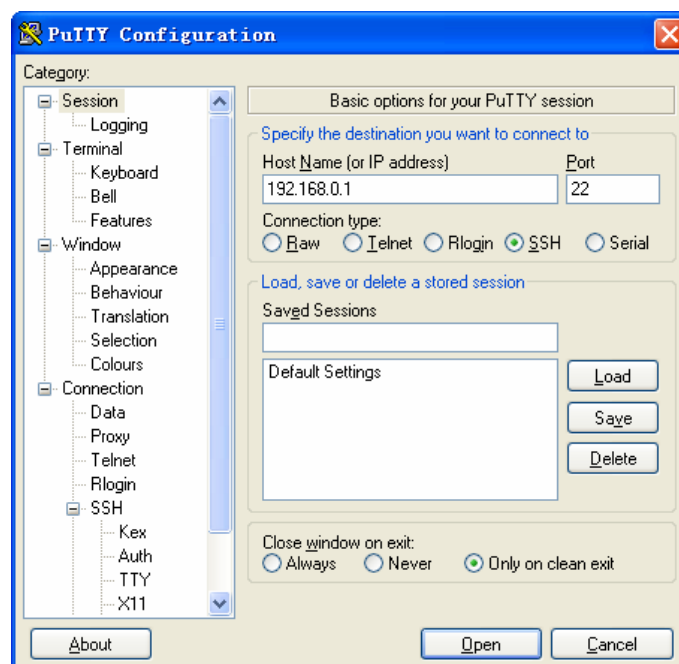

Key File:

Note:

- The key type should accord with the type of the key file.
- The SSH key downloading can not be interrupted.
- Download the private key file to SSH client software.

- After the public key and private key are downloaded, please log on to the interface of PuTTY and enter the IP address for login.

After successful authentication, please enter the login user name. If you log on to the switch without entering password, it indicates that the key has been successfully downloaded.

```
192.168.0.1 - PuTTY
login as: admin
Further authentication required
Authenticating with public key "rsa-key-20100120" from agent
TL-SL5428E>
```

[Return to CONTENTS](#)

Chapter 5 Switching

Switching module is used to configure the basic functions of the switch, including four submenus: **Port**, **LAG**, **Traffic Monitor** and **MAC Address**.

5.1 Port

The Port function, allowing you to configure the basic features for the port, is implemented on the **Port Config**, **Port Mirror**, **Port Security**, **Port Isolation** and **Loopback Detection** pages.

5.1.1 Port Config

On this page, you can configure the basic parameters for the ports. When the port is disabled, the packets on the port will be discarded. Disabling the port which is vacant for a long time can reduce the power consumption effectively. And you can enable the port when it is in need.

The parameters will affect the working mode of the port, please set the parameters appropriate to your needs.

Choose the menu **Switching**→**Port**→**Port Config** to load the following page.

Select	Port	Description	Status	Speed and Duplex	Flow Control	LAG
<input type="checkbox"/>		<input type="text"/>	Disable	10MHD	Disable	
<input type="checkbox"/>	1		Enable	Auto	Disable	---
<input type="checkbox"/>	2		Enable	Auto	Disable	---
<input type="checkbox"/>	3		Enable	Auto	Disable	---
<input type="checkbox"/>	4		Enable	Auto	Disable	---
<input type="checkbox"/>	5		Enable	Auto	Disable	---
<input type="checkbox"/>	6		Enable	Auto	Disable	---
<input type="checkbox"/>	7		Enable	Auto	Disable	---
<input type="checkbox"/>	8		Enable	Auto	Disable	---
<input type="checkbox"/>	9		Enable	Auto	Disable	---
<input type="checkbox"/>	10		Enable	Auto	Disable	---
<input type="checkbox"/>	11		Enable	Auto	Disable	---
<input type="checkbox"/>	12		Enable	Auto	Disable	---
<input type="checkbox"/>	13		Enable	Auto	Disable	---
<input type="checkbox"/>	14		Enable	Auto	Disable	---
<input type="checkbox"/>	15		Enable	Auto	Disable	---

Note:
The Port Description should be not more than 16 characters.

Figure 5-1 Port Config

The following entries are displayed on this screen.

➤ Port Config

- Port Select:** Click the **Select** button to quick-select the corresponding port based on the port number you entered.
- Select:** Select the desired port for configuration. It is multi-optional.
- Port:** Displays the port number.
- Description:** Give a description to the port for identification.

Status: Allows you to Enable/Disable the port. When Enable is selected, the port can forward the packets normally.

Speed and Duplex: Select the Speed and Duplex mode for the port. The device connected to the switch should be in the same Speed and Duplex mode with the switch. When “Auto” is selected, the Speed and Duplex mode will be determined by auto-negotiation.

Flow Control: Allows you to Enable/Disable the Flow Control feature. When Flow Control is enabled, the switch can synchronize the speed with its peer to avoid the packet loss caused by congestion.

LAG: Displays the LAG number which the port belongs to.

Note:

1. The switch can not be managed through the disabled port. Please enable the port which is used to manage the switch.
2. The parameters of the port members in a LAG should be set as the same.

5.1.2 Port Mirror

Port Mirror, the packets obtaining technology, functions to forward copies of packets from one/multiple ports (mirrored port) to a specific port (mirroring port). Usually, the mirroring port is connected to a data diagnose device, which is used to analyze the mirrored packets for monitoring and troubleshooting the network.

Choose the menu **Switching**→**Port**→**Port Mirror** to load the following page.

Mirroring Port:

Mirrored Port

Select	Port	Ingress	Egress	LAG
<input type="checkbox"/>		<input type="button" value="Disable"/>	<input type="button" value="Disable"/>	
<input type="checkbox"/>	1	Disable	Disable	---
<input type="checkbox"/>	2	Disable	Disable	---
<input type="checkbox"/>	3	Disable	Disable	---
<input type="checkbox"/>	4	Disable	Disable	---
<input type="checkbox"/>	5	Disable	Disable	---
<input type="checkbox"/>	6	Disable	Disable	---
<input type="checkbox"/>	7	Disable	Disable	---
<input type="checkbox"/>	8	Disable	Disable	---
<input type="checkbox"/>	9	Disable	Disable	---
<input type="checkbox"/>	10	Disable	Disable	---
<input type="checkbox"/>	11	Disable	Disable	---
<input type="checkbox"/>	12	Disable	Disable	---

Figure 5-2 Port Mirror Config

The following entries are displayed on this screen.

➤ **Mirroring Port**

Mirroring Port: Select a port from the pull-down list as the mirroring port. When disable is selected, the Port Mirror feature will be disabled.

➤ **Mirrored Port**

Port Select: Click the **Select** button to quick-select the corresponding port based on the port number you entered.

Select: Select the desired port as a mirrored port. It is multi-optional.

Port: Displays the port number.

Ingress: Select Enable/Disable the Ingress feature. When the Ingress is enabled, the incoming packets received by the mirrored port will be copied to the mirroring port.

Egress: Select Enable/Disable the Egress feature. When the Egress is enabled, the outgoing packets sent by the mirrored port will be copied to the mirroring port.

LAG: Displays the LAG number which the port belongs to. The LAG member can not be selected as the mirrored port or mirroring port.

Note:

1. The LAG member can not be selected as the mirrored port or mirroring port.
2. A port can not be set as the mirrored port and the mirroring port simultaneously.
3. The Port Mirror function can take effect span the multiple VLANs.

5.1.3 Port Security

MAC Address Table maintains the mapping relationship between the port and the MAC address of the connected device, which is the base of the packet forwarding. The capacity of MAC Address Table is fixed. MAC Address Attack is the attack method that the attacker takes to obtain the network information illegally. The attacker uses tools to generate the cheating MAC address and quickly occupy the MAC Address Table. When the MAC Address Table is full, the switch will broadcast the packets to all the ports. At this moment, the attacker can obtain the network information via various sniffers and attacks. When the MAC Address Table is full, the packets traffic will flood to all the ports, which results in overload, lower speed, packets drop and even breakdown of the system.

Port Security is to protect the switch from the malicious MAC Address Attack by limiting the maximum number of MAC addresses that can be learned on the port. The port with Port Security feature enabled will learn the MAC address dynamically. When the learned MAC address number reaches the maximum, the port will stop learning. Thereafter, the other devices with the MAC address unlearned can not access to the network via this port.

Choose the menu **Switching**→**Port**→**Port Security** to load the following page.

Port Security					
Select	Port	Max Learned MAC	Learned Num	Learn Mode	Status
<input type="checkbox"/>		<input type="text" value=""/>		Dynamic	Disable
<input type="checkbox"/>	1	64	0	Dynamic	Disable
<input type="checkbox"/>	2	64	0	Dynamic	Disable
<input type="checkbox"/>	3	64	0	Dynamic	Disable
<input type="checkbox"/>	4	64	0	Dynamic	Disable
<input type="checkbox"/>	5	64	0	Dynamic	Disable
<input type="checkbox"/>	6	64	0	Dynamic	Disable
<input type="checkbox"/>	7	64	0	Dynamic	Disable
<input type="checkbox"/>	8	64	0	Dynamic	Disable
<input type="checkbox"/>	9	64	0	Dynamic	Disable
<input type="checkbox"/>	10	64	0	Dynamic	Disable
<input type="checkbox"/>	11	64	0	Dynamic	Disable
<input type="checkbox"/>	12	64	0	Dynamic	Disable

Note:

The maximum number of MAC addresses learned from individual port can be set to 64.

Figure 5-3 Port Security

The following entries are displayed on this screen:

➤ **Port Security**

- Select:** Select the desired port for Port Security configuration. It is multi-optional.
- Port:** Displays the port number.
- Max Learned MAC:** Specify the maximum number of MAC addresses that can be learned on the port.
- Learned Num:** Displays the number of MAC addresses that have been learned on the port.
- Learn Mode:** Select the Learn Mode for the port.
- **Dynamic:** When Dynamic mode is selected, the learned MAC address will be deleted automatically after the aging time.
 - **Static:** When Static mode is selected, the learned MAC address will be out of the influence of the aging time and can only be deleted manually. The learned entries will be cleared after the switch is rebooted.
 - **Permanent:** When Permanent mode is selected, the learned MAC address will be out of the influence of the aging time and can only be deleted manually. The learned entries will be saved even the switch is rebooted.
- Status:** Select Enable/Disable the Port Security feature for the port.

Note:

1. The Port Security function is disabled for the LAG port member. Only the port is removed from the LAG, will the Port Security function be available for the port.
2. The Port Security function is disabled when the 802.1X function is enabled.

5.1.4 Port Isolation

Port Isolation provides a method of restricting traffic flow to improve the network security by forbidding the port to forward packets to the ports that are not on its forward portlist.

Choose the menu **Switching**→**Port**→**Port Isolation** to load the following page.

The screenshot shows two parts of a web interface. The top part is the 'Port Isolation Config' page, which has a title bar and two dropdown menus for 'From Port' and 'To Port', both set to '1'. Below these is a 'Forward Portlist' section with a grid of checkboxes for ports 1 through 28. At the bottom of this section are three buttons: 'All', 'Apply', and 'Help'. The bottom part is the 'Port Isolation List' table, which has two columns: 'Port' and 'Forward Portlist'. The table contains 15 rows, each with a port number and the value '1-28'.

Port	Forward Portlist
1	1-28
2	1-28
3	1-28
4	1-28
5	1-28
6	1-28
7	1-28
8	1-28
9	1-28
10	1-28
11	1-28
12	1-28
13	1-28
14	1-28
15	1-28

Figure 5-4 Port Isolation Config

The following entries are displayed on this screen:

➤ **Port Isolation Config**

From/To Port: Select the port number to set its forwardlist.

Forward Portlist: Select the port(s) to be forwarded to.

➤ **Port Isolation List**

Port: Display the port number.

Forward Portlist: Display the forwardlist.

5.1.5 Loopback Detection

With loopback detection feature enabled, the switch can detect loops using loopback detection packets. When a loop is detected, the switch will display an alert or further block the corresponding port according to the port configuration.

Choose the menu **Switching**→**Port**→**LoopbackDetection** to load the following page.

Global config

LoopbackDetection Status: enable disable

Detection Interval: seconds(1-1000)

Automatic Recovery Time: detection times(1-100) Apply

Web Refresh Status: enable disable

Web Refresh Interval: seconds(3-100)

Port config

Port Select

Select	Port	Status	Operation mode	Recovery mode	Loop status	Block status	LAG
<input type="checkbox"/>		disable	Alert	Auto			
<input type="checkbox"/>	1	Disable	Alert	Auto	---	---	---

<input type="checkbox"/>	15	Disable	Alert	Auto	---	---	---

Apply
Manual Recover
Help

Note:
 Recovery mode is just useful to process not in Alert process mode.
 LoopbackDetection must coordinate with storm control.

Figure 5-5 Loopback Detection Config

The following entries are displayed on this screen:

➤ **Global Config**

LoopbackDetection Status:

Here you can enable or disable Loopback Detection function globally.

Detection Interval:

Set a Loopback Detection interval between 1 and 1000 seconds. By default, it's 30 seconds.

Automatic Recovery Time:

Time after which the blocked port would automatically recover to normal status. It can be set as integral times of detection interval.

Web Refresh Status:

Here you can enable or disable web automatic refresh.

Web Refresh Interval:

Set a web refresh interval between 3 and 100 seconds. By default, it's 6 seconds.

➤ Port Config

Port Select:	Click the Select button to quick-select the corresponding port based on the port number you entered.
Select:	Select the desired port for Loopback Detection configuration. It is multi-optional.
Port:	Displays the port number.
Status:	Enable or disable Loopback Detection function for the port.
Operation Mode:	Select the mode how the switch processes the detected loops. <ul style="list-style-type: none">● Alert: When a loop is detected, display an alert.● Port based: When a loop is detected, display an alert and block the port.
Recovery Mode:	Select the mode how the blocked port recovers to normal status. <ul style="list-style-type: none">● Auto: Block status can be automatically removed after recovery time.● Manual: Block status only can be removed manually.
Loop Status:	Displays the port status whether a loopback is detected.
Block Status:	Displays the port status about block or unblock.
LAG:	Displays the LAG number the port belongs to.
Manual Recover:	Manually remove the block status of selected ports.

Note:

1. Recovery Mode is not selectable when Alert is chosen in Operation Mode.
2. Loopback Detection must coordinate with storm control.

5.2 LAG

LAG (Link Aggregation Group) is to combine a number of ports together to make a single high-bandwidth data path, so as to implement the traffic load sharing among the member ports in the group and to enhance the connection reliability.

For the member ports in an aggregation group, their basic configuration must be the same. The basic configuration includes **STP, QoS, GVRP, VLAN, port attributes, MAC Address Learning mode** and other associated settings. The further explains are as following:

- If the ports, which are enabled for the **GVRP, 802.1Q VLAN, Voice VLAN, STP, QoS, Port Isolation, DHCP Snooping** and **Port Configuration (Speed, Flow Control)**, are in a LAG, their configurations should be the same.
- The ports, which are enabled for the **Port Security, Port Mirror, MAC Address Filtering, Static MAC Address Binding, 802.1X Authentication, IP Source Guard**, and **half-duplex** can not be added to the LAG.
- It's not suggested to add the ports with **ARP Inspection** and **DoS Defend** enabled to the LAG.

If the LAG is needed, you are suggested to configure the LAG function here before configuring the other functions for the member ports.

Tips:

1. Calculate the bandwidth for a LAG: If a LAG consists of the four ports in the speed of 1000Mbps Full Duplex, the whole bandwidth of the LAG is up to 8000Mbps (2000Mbps * 4) because the bandwidth of each member port is 2000Mbps counting the up-linked speed of 1000Mbps and the down-linked speed of 1000Mbps.
2. The traffic load of the LAG will be balanced among the ports according to the Aggregate Arithmetic. If the connections of one or several ports are broken, the traffic of these ports will be transmitted on the normal ports, so as to guarantee the connection reliability.

Depending on different aggregation modes, aggregation groups fall into two types: **Static LAG** and **LACP Config**. The LAG function is implemented on the **LAG Table**, **Static LAG** and **LACP Config** configuration pages.

5.2.1 LAG Table

On this page, you can view the information of the current LAG of the switch.

Choose the menu **Switching**→**LAG**→**LAG Table** to load the following page.

Global Config

Hash Algorithm:

Select	Group Number	Description	Member	Operation
<input type="checkbox"/>	LAG1	Static LAG	24, 25, 26	Edit Detail

Note:

1. The LAG created by LACP can't be deleted.

Figure 5-6 LAG Table

The following entries are displayed on this screen:

➤ **Global Config**

Hash Algorithm:

Select the applied scope of aggregate hash arithmetic, which results in choosing a port to transfer the packets.

- **SRC MAC + DST MAC:** When this option is selected, the Aggregate Arithmetic will apply to the source and destination MAC addresses of the packets.
- **SRC IP + DST IP:** When this option is selected, the Aggregate Arithmetic will apply to the source and destination IP addresses of the packets.

➤ **LAG Table**

Select:

Select the desired LAG. It is multi-optional.

Group Number:

Displays the LAG number here.

- Description:** Displays the description of LAG.
- Member:** Displays the LAG member.
- Operation:** Allows you to view or modify the information for each LAG.
- **Edit:** Click to modify the settings of the LAG.
 - **Detail:** Click to get the information of the LAG.

Click the **Detail** button for the detailed information of your selected LAG.

Figure 5-7 Detail Information

5.2.2 Static LAG

On this page, you can manually configure the LAG. The LACP feature is disabled for the member ports of the manually added Static LAG.

Choose the menu **Switching**→**LAG**→**Static LAG** to load the following page.

LAG Config	
Group Number:	<input type="text" value="LAG1"/>
Description:	<input type="text" value="Static LAG"/>

Member Port					
<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4	<input type="checkbox"/> 5	<input type="checkbox"/> 6
<input type="checkbox"/> 7	<input type="checkbox"/> 8	<input type="checkbox"/> 9	<input type="checkbox"/> 10	<input type="checkbox"/> 11	<input type="checkbox"/> 12
<input type="checkbox"/> 13	<input type="checkbox"/> 14	<input type="checkbox"/> 15	<input type="checkbox"/> 16	<input type="checkbox"/> 17	<input type="checkbox"/> 18
<input type="checkbox"/> 19	<input type="checkbox"/> 20	<input type="checkbox"/> 21	<input type="checkbox"/> 22	<input type="checkbox"/> 23	<input checked="" type="checkbox"/> 24 (LAG1)
<input checked="" type="checkbox"/> 25 (LAG1)	<input checked="" type="checkbox"/> 26 (LAG1)	<input type="checkbox"/> 27	<input type="checkbox"/> 28		

Note:

1. LAG* denotes the Link Aggregation Group which the port belongs to.
2. It's not suggested to set 100M and 1000M ports in the same LAG.
3. The LAG created by LACP can't be modified.

Figure 5-8 Static LAG Config

The following entries are displayed on this screen:

➤ **LAG Config**

Group Number: Select a Group Number for the LAG.

Description: Give a description to the LAG for identification.

➤ **LAG Table**

Member Port: Select the port as the LAG member. Clearing all the ports of the LAG will delete this LAG.

Tips:

1. The LAG can be deleted by clearing its all member ports.
2. A port can only be added to a LAG. If a port is the member of a LAG or is dynamically aggregated as the LACP member, the port number will be displayed in gray and can not be selected.

5.2.3 LACP Config

LACP (Link Aggregation Control Protocol) is defined in IEEE802.3ad/802.1ax and enables the dynamic link aggregation and disaggregation by exchanging LACP packets with its partner. The switch can dynamically group similarly configured ports into a single logical link, which will highly extend the bandwidth and flexibly balance the load.

With the LACP feature enabled, the port will notify its partner of the system priority, system MAC, port priority, port number and operation key (operation key is determined by the physical properties of the port, upper layer protocol and admin key). The device with higher priority will lead the aggregation and disaggregation. System priority and system MAC decide the priority of the device. The smaller the system priority, the higher the priority of the device is. With the same system priority, the device owning the smaller system MAC has the higher priority. The device with the higher priority will choose the ports to be aggregated based on the port priority, port number and operation key. Only the ports with the same operation key can be selected into the same aggregation group. In an aggregation group, the port with smaller port priority will be considered as the preferred one. If the two port priorities are equal, the port with smaller port number is preferred. After an aggregation group is established, the selected ports can be aggregated together as one port to transmit packets.

On this page, you can configure the LACP feature of the switch.

Choose the menu **Switching**→**LAG**→**LACP Config** to load the following page.

Global Config

System Priority: (0 - 65535)

LACP Config

Port

Select	Port	Admin Key	Port Priority (0-65535)	Status	LAG
<input type="checkbox"/>		<input type="text"/>	<input type="text"/>	Disable ▾	
<input type="checkbox"/>	1	1	32768	Disable	---
<input type="checkbox"/>	2	1	32768	Disable	---
<input type="checkbox"/>	3	1	32768	Disable	---
<input type="checkbox"/>	4	1	32768	Disable	---
<input type="checkbox"/>	5	1	32768	Disable	---
<input type="checkbox"/>	6	1	32768	Disable	---
<input type="checkbox"/>	7	1	32768	Disable	---
<input type="checkbox"/>	8	1	32768	Disable	---
<input type="checkbox"/>	9	1	32768	Disable	---
<input type="checkbox"/>	10	1	32768	Disable	---
<input type="checkbox"/>	11	1	32768	Disable	---
<input type="checkbox"/>	12	1	32768	Disable	---
<input type="checkbox"/>	13	1	32768	Disable	---
<input type="checkbox"/>	14	1	32768	Disable	---
<input type="checkbox"/>	15	1	32768	Disable	---

Note:

1. To avoid any broadcast storm when LACP takes effect, you are suggested to enable Spanning Tree function.
2. LACP function can't be enabled for the port already in a static link aggregation group.

Figure 5-9 LACP Config

The following entries are displayed on this screen:

➤ **Global Config**

System Priority:

Specify the system priority for the switch. The system priority and MAC address constitute the system identification (ID). A lower system priority value indicates a higher system priority. When exchanging information between systems, the system with higher priority determines which link aggregation a link belongs to, and the system with lower priority adds the proper links to the link aggregation according to the selection of its partner.

➤ **LACP Config**

Port Select:

Click the **Select** button to quick-select the corresponding port based on the port number you entered.

Select:

Select the desired port for LACP configuration. It is multi-optional.

Port:

Displays the port number.

Admin Key:

Specify an Admin Key for the port. The member ports in a dynamic aggregation group must have the same Admin Key.

Port Priority:

Specify a Port Priority for the port. This value determines the priority of the port to be selected as the dynamic aggregation group member. The port with smaller Port Priority will be considered as the preferred one. If the two port priorities are equal; the port with smaller port number is preferred.

Status: Enable/Disable the LACP feature for your selected port.

LAG: Displays the LAG number which the port belongs to.

5.3 Traffic Monitor

The Traffic Monitor function, monitoring the traffic of each port, is implemented on the **Traffic Summary** and **Traffic Statistics** pages.

5.3.1 Traffic Summary

Traffic Summary screen displays the traffic information of each port, which facilitates you to monitor the traffic and analyze the network abnormality.

Choose the menu **Switching**→**Traffic Monitor**→**Traffic Summary** to load the following page.

The screenshot shows the 'Traffic Summary' interface. At the top, there is an 'Auto Refresh' section with radio buttons for 'Enable' and 'Disable' (selected), and a 'Refresh Rate' input field set to 'sec (3-300)'. Below this is a table with columns for 'Port', 'Packets Rx', 'Packets Tx', 'Octets Rx', 'Octets Tx', and 'Statistics'. The table lists ports 1 through 12, all with zero traffic. A 'Port' dropdown menu is set to 'Select'. At the bottom, there are 'Refresh', 'Clear', and 'Help' buttons.

Port	Packets Rx	Packets Tx	Octets Rx	Octets Tx	Statistics
1	0	0	0	0	Statistics
2	0	0	0	0	Statistics
3	0	0	0	0	Statistics
4	0	0	0	0	Statistics
5	0	0	0	0	Statistics
6	0	0	0	0	Statistics
7	0	0	0	0	Statistics
8	0	0	0	0	Statistics
9	0	0	0	0	Statistics
10	0	0	0	0	Statistics
11	0	0	0	0	Statistics
12	0	0	0	0	Statistics

Figure 5-10 Traffic Summary

The following entries are displayed on this screen:

➤ **Auto Refresh**

Auto Refresh: Allows you to Enable/Disable refreshing the Traffic Summary automatically.

Refresh Rate: Enter a value in seconds to specify the refresh interval.

➤ **Traffic Summary**

Port Select: Click the **Select** button to quick-select the corresponding port based on the port number you entered.

Port: Displays the port number.

Packets Rx: Displays the number of packets received on the port. The error packets are not counted in.

- Packets Tx:** Displays the number of packets transmitted on the port.
- Octets Rx:** Displays the number of octets received on the port. The error octets are counted in.
- Octets Tx:** Displays the number of octets transmitted on the port.
- Statistics:** Click the **Statistics** button to view the detailed traffic statistics of the port.

5.3.2 Traffic Statistics

Traffic Statistics screen displays the detailed traffic information of each port, which facilitates you to monitor the traffic and locate faults promptly.

Choose the menu **Switching**→**Traffic Monitor**→**Traffic Statistics** to load the following page.

Auto Refresh

Figure 5-11 Traffic Statistics

The following entries are displayed on this screen:

➤ **Auto Refresh**

Auto Refresh: Allows you to Enable/Disable refreshing the Traffic Summary automatically.

Refresh Rate: Enter a value in seconds to specify the refresh interval.

➤ **Statistics**

Port: Enter a port number and click the **Select** button to view the traffic statistics of the corresponding port.

Received: Displays the details of the packets received on the port.

Sent:	Displays the details of the packets transmitted on the port.
Broadcast:	Displays the number of good broadcast packets received or transmitted on the port. The error frames are not counted in.
Multicast:	Displays the number of good multicast packets received or transmitted on the port. The error frames are not counted in.
Unicast:	Displays the number of good unicast packets received or transmitted on the port. The error frames are not counted in.
Alignment Errors:	Displays the number of the received packets that have a bad Frame Check Sequence (FCS) with a non-integral octet (Alignment Error) and have a bad FCS with an integral octet (CRC Error). The length of the packet is between 64 bytes and 1518 bytes.
UndersizePkts:	Displays the number of the received packets (excluding error packets) that are less than 64 bytes long.
Pkts64Octets:	Displays the number of the received packets (including error packets) that are 64 bytes long.
Pkts65to127Octets:	Displays the number of the received packets (including error packets) that are between 65 and 127 bytes long.
Pkts128to255Octets:	Displays the number of the received packets (including error packets) that are between 128 and 255 bytes long.
Pkts256to511Octets:	Displays the number of the received packets (including error packets) that are between 256 and 511 bytes long.
Pkts512to1023Octets:	Displays the number of the received packets (including error packets) that are between 512 and 1023 bytes long.
PktsOver1023Octets:	Displays the number of the received packets (including error packets) that are more than 1023 bytes long.
Collisions:	Displays the number of collisions experienced by a port during packet transmissions.

5.4 MAC Address

The main function of the switch is forwarding the packets to the correct ports based on the destination MAC address of the packets. Address Table contains the port-based MAC address information, which is the base for the switch to forward packets quickly. The entries in the Address Table can be updated by auto-learning or configured manually. Most the entries are generated and updated by auto-learning. In the stable networks, the static MAC address entries can facilitate the switch to reduce broadcast packets and enhance the efficiency of packets forwarding remarkably. The address filtering feature allows the switch to filter the undesired packets and forbid its forwarding so as to improve the network security.

The types and the features of the MAC Address Table are listed as the following:

Type	Configuration Way	Aging out	Being kept after reboot (if the configuration is saved)	Relationship between the bound MAC address and the port
Static Address Table	Manually configuring	No	Yes	The bound MAC address can not be learned by the other ports in the same VLAN.
Dynamic Address Table	Automatically learning	Yes	No	The bound MAC address can be learned by the other ports in the same VLAN.
Filtering Address Table	Manually configuring	No	Yes	-

Table 5-1 Types and features of Address Table

This function includes four submenus: **Address Table**, **Static Address**, **Dynamic Address** and **Filtering Address**.

5.4.1 Address Table

On this page, you can view all the information of the Address Table.

Choose the menu **Switching**→**MAC Address**→**Address Table** to load the following page.

Search Option

MAC Address: (Format: 00-00-00-00-00-01)
 VLAN ID: (1-4094)
 Port:
 Type: All Static Dynamic Filtering

Address Table

MAC Address	VLAN ID	Port	Type	Aging Status
6C-62-6D-F5-9D-86	1	6	Dynamic	Aging

Total MAC Address: 1

Note:
The maximum of the displayed entries is 100 by default, please click the Search button to get the complete address entries.

Figure 5-12 Address Table

The following entries are displayed on this screen:

➤ **Search Option**

MAC Address: Enter the MAC address of your desired entry.

VLAN ID: Enter the VLAN ID of your desired entry.

Port: Select the corresponding port number of your desired entry.

Type:

Select the type of your desired entry.

- **All:** This option allows the address table to display all the address entries.
- **Static:** This option allows the address table to display the static address entries only.
- **Dynamic:** This option allows the address table to display the dynamic address entries only.
- **Filtering:** This option allows the address table to display the filtering address entries only.

➤ **Address Table**

MAC Address:

Displays the MAC address learned by the switch.

VLAN ID:

Displays the corresponding VLAN ID of the MAC address.

Port:

Displays the corresponding Port number of the MAC address.

Type:

Displays the Type of the MAC address.

Aging Status:

Displays the Aging status of the MAC address.

5.4.2 Static Address

The static address table maintains the static address entries which can be added or removed manually, independent of the aging time. In the stable networks, the static MAC address entries can facilitate the switch to reduce broadcast packets and remarkably enhance the efficiency of packets forwarding without learning the address. The static MAC address learned by the port with **Port Security** enabled in the static learning mode will be displayed in the Static Address Table.

Choose the menu **Switching**→**MAC Address**→**Static Address** to load the following page.

Create Static Address

MAC Address: (Format: 00-00-00-00-00-01)

VLAN ID: (1-4094)

Port:

Search Option:

Static Address Table

Select	MAC Address	VLAN ID	Port	Type	Aging Status
<input type="checkbox"/>			Port 1 <input type="button" value="v"/>		

Total MAC Address: 0

Note:
The maximum of the displayed entries is 100 by default, please click the Search button to get the complete address entries.

Figure 5-13 Static Address

The following entries are displayed on this screen:

➤ **Create Static Address**

- MAC Address:** Enter the static MAC Address to be bound.
- VLAN ID:** Enter the corresponding VLAN ID of the MAC address.
- Port:** Select a port from the pull-down list to be bound.

➤ **Search Option**

- Search Option:** Select a Search Option from the pull-down list and click the **Search** button to find your desired entry in the Static Address Table.
- **MAC:** Enter the MAC address of your desired entry.
 - **VLAN ID:** Enter the VLAN ID number of your desired entry.
 - **Port:** Enter the Port number of your desired entry.

➤ **Static Address Table**

- Select:** Select the entry to delete or modify the corresponding port number. It is multi-optional.
- MAC Address:** Displays the static MAC Address.
- VLAN ID:** Displays the corresponding VLAN ID of the MAC address.
- Port:** Displays the corresponding Port number of the MAC address. Here you can modify the port number to which the MAC address is bound. The new port should be in the same VLAN.
- Type:** Displays the Type of the MAC address.
- Aging Status:** Displays the Aging Status of the MAC address.

Note:

1. If the corresponding port number of the MAC address is not correct, or the connected port (or the device) has been changed, the switch can not be forward the packets correctly. Please reset the static address entry appropriately.
2. If the MAC address of a device has been added to the Static Address Table, connecting the device to another port will cause its address not to be recognized dynamically by the switch. Therefore, please ensure the entries in the Static Address Table are correct and valid.
3. The MAC address in the Static Address Table can not be added to the Filtering Address Table or bound to a port dynamically.
4. This static MAC address bound function is not available if the 802.1X feature is enabled.

5.4.3 Dynamic Address

The dynamic address can be generated by the auto-learning mechanism of the switch. The Dynamic Address Table can update automatically by auto-learning or the MAC address aging out mechanism.

To fully utilize the MAC address table, which has a limited capacity, the switch adopts an aging mechanism for updating the table. That is, the switch removes the MAC address entries related to a network device if no packet is received from the device within the aging time.

On this page, you can configure the dynamic MAC address entry.

Choose the menu **Switching**→**MAC Address**→**Dynamic Address** to load the following page.

Aging Config

Auto Aging: Enable Disable

Aging Time: sec (10-630, default: 300)

Search Option

Search Option:

Dynamic Address Table

Select	MAC Address	VLAN ID	Port	Type	Aging Status
<input type="checkbox"/>	6C-62-6D-F5-9D-86	1	6	Dynamic	Aging

Total MAC Address: 1

Note:
The maximum of the displayed entries is 100 by default, please click the Search button to get the complete address entries.

Figure 5-14 Dynamic Address

The following entries are displayed on this screen:

➤ **Aging Config**

Auto Aging: Allows you to Enable/Disable the Auto Aging feature.

Aging Time: Enter the Aging Time for the dynamic address.

➤ **Search Option**

Search Option: Select a Search Option from the pull-down list and click the **Search** button to find your desired entry in the Dynamic Address Table.

- **MAC:** Enter the MAC address of your desired entry.
- **VLAN ID:** Enter the VLAN ID number of your desired entry.
- **Port:** Enter the Port number of your desired entry.
- **LAG ID:** Enter the LAG ID number of your desired entry.

➤ **Dynamic Address Table**

Select: Select the entry to delete the dynamic address or to bind the MAC address to the corresponding port statically. It is multi-optional.

MAC Address: Displays the dynamic MAC Address.

VLAN ID: Displays the corresponding VLAN ID of the MAC address.

Port: Displays the corresponding port number of the MAC address.

Type: Displays the Type of the MAC address.

Aging Status: Displays the Aging Status of the MAC address.

Bind: Click the **Bind** button to bind the MAC address of your selected entry to the corresponding port statically.

Tips:

Setting aging time properly helps implement effective MAC address aging. The aging time that is too long or too short results decreases the performance of the switch. If the aging time is too long, excessive invalid MAC address entries maintained by the switch may fill up the MAC address table. This prevents the MAC address table from updating with network changes in time. If the aging time is too short, the switch may remove valid MAC address entries. This decreases the forwarding performance of the switch. It is recommended to keep the default value.

5.4.4 Filtering Address

The filtering address is to forbid the undesired packets to be forwarded. The filtering address can be added or removed manually, independent of the aging time. The filtering MAC address allows the switch to filter the packets which includes this MAC address as the source address or destination address, so as to guarantee the network security. The filtering MAC address entries act on all the ports in the corresponding VLAN.

Choose the menu **Switching**→**MAC Address**→**Filtering Address** to load the following page.

Create Filtering Address

MAC Address: (Format: 00-00-00-00-00-01)

VLAN ID: (1-4094)

Search Option

Search Option:

Filtering Address Table

Select	MAC Address	VLAN ID	Port	Type	Aging Status
--------	-------------	---------	------	------	--------------

Total MAC Address: 0

Note:
The maximum of the displayed entries is 100 by default, please click the Search button to get the complete address entries.

Figure 5-15 Filtering Address

The following entries are displayed on this screen:

➤ **Create Filtering Address**

MAC Address: Enter the MAC Address to be filtered.

VLAN ID: Enter the corresponding VLAN ID of the MAC address.

➤ **Search Option**

Search Option: Select a Search Option from the pull-down list and click the **Search** button to find your desired entry in the Filtering Address Table.

- **MAC Address:** Enter the MAC address of your desired entry.
- **VLAN ID:** Enter the VLAN ID number of your desired entry.

➤ **Filtering Address Table**

Select:	Select the entry to delete the corresponding filtering address. It is multi-optional.
MAC Address:	Displays the filtering MAC Address.
VLAN ID:	Displays the corresponding VLAN ID.
Port:	Here the symbol “__” indicates no specified port.
Type:	Displays the Type of the MAC address.
Aging Status:	Displays the Aging Status of the MAC address.

Note:

1. The MAC address in the Filtering Address Table can not be added to the Static Address Table or bound to a port dynamically.
2. This MAC address filtering function is not available if the 802.1X feature is enabled.

Chapter 6 VLAN

The traditional Ethernet is a data network communication technology basing on CSMA/CD (Carrier Sense Multiple Access/Collision Detect) via shared communication medium. Through the traditional Ethernet, the overfull hosts in LAN will result in serious collision, flooding broadcasts, poor performance or even breakdown of the Internet. Though connecting the LANs through switches can avoid the serious collision, the flooding broadcasts can not be prevented, which will occupy plenty of bandwidth resources, causing potential serious security problems.

A Virtual Local Area Network (VLAN) is a network topology configured according to a logical scheme rather than the physical layout. The VLAN technology is developed for switches to control broadcast in LANs. By creating VLANs in a physical LAN, you can divide the LAN into multiple logical LANs, each of which has a broadcast domain of its own. Hosts in the same VLAN communicate with one another as if they are in a LAN. However, hosts in different VLANs cannot communicate with one another directly. Therefore, broadcast packets are limited in a VLAN. Hosts in the same VLAN communicate with one another via Ethernet whereas hosts in different VLANs communicate with one another through the Internet devices such as Router, the Layer3 switch, etc. The following figure illustrates a VLAN implementation.

Figure 6-1 VLAN implementation

Compared with the traditional Ethernet, VLAN enjoys the following advantages.

- (1) Broadcasts are confined to VLANs. This decreases bandwidth utilization and improves network performance.
- (2) Network security is improved. VLANs cannot communicate with one another directly. That is, a host in a VLAN cannot access resources in another VLAN directly, unless routers or Layer 3 switches are used.
- (3) Network configuration workload for the host is reduced. VLAN can be used to group specific hosts. When the physical position of a host changes within the range of the VLAN, you need not to change its network configuration.

A VLAN can span across multiple switches, or even routers. This enables hosts in a VLAN to be dispersed in a looser way. That is, hosts in a VLAN can belong to different physical network segment. This switch supports three ways, namely, 802.1Q VLAN, MAC VLAN and Protocol VLAN, to classify VLANs. VLAN tags in the packets are necessary for the switch to identify packets of different VLANs. The switch can analyze the received untagged packets on the port and match the packets with the MAC VLAN, Protocol VLAN and 802.1Q VLAN in turn. If a packet is matched, the switch will add a corresponding VLAN tag to it and forward it in the corresponding VLAN.

6.1 802.1Q VLAN

VLAN tags in the packets are necessary for the switch to identify packets of different VLANs. The switch works at the data link layer in OSI model and it can identify the data link layer encapsulation of the packet only, so you can add the VLAN tag field into the data link layer encapsulation for identification.

In 1999, IEEE issues the IEEE 802.1Q protocol to standardize VLAN implementation, defining the structure of VLAN-tagged packets. IEEE 802.1Q protocol defines that a 4-byte VLAN tag is encapsulated after the destination MAC address and source MAC address to show the information about VLAN.

As shown in the following figure, a VLAN tag contains four fields, including TPID (Tag Protocol Identifier), Priority, CFI (Canonical Format Indicator), and VLAN ID.

Figure 6-2 Format of VLAN Tag

- (1) **TPID:** TPID is a 16-bit field, indicating that this data frame is VLAN-tagged. By default, it is 0x8100.
- (2) **Priority:** Priority is a 3-bit field, referring to 802.1p priority. Refer to section “QoS & QoS profile” for details.
- (3) **CFI:** CFI is a 1-bit field, indicating whether the MAC address is encapsulated in the standard format in different transmission media. This field is not described in detail in this chapter.
- (4) **VLAN ID:** VLAN ID is a 12-bit field, indicating the ID of the VLAN to which this packet belongs. It is in the range of 0 to 4,095. Generally, 0 and 4,095 is not used, so the field is in the range of 1 to 4,094.

VLAN ID identifies the VLAN to which a packet belongs. When the switch receives an un-VLAN-tagged packet, it will encapsulate a VLAN tag with the default VLAN ID of the inbound port for the packet, and the packet will be assigned to the default VLAN of the inbound port for transmission.

In this User Guide, the tagged packet refers to the packet with VLAN tag whereas the untagged packet refers to the packet without VLAN tag, and the priority-tagged packet refers to the packet with VLAN tag whose VLAN ID is 0.

> Link Types of ports

When creating the 802.1Q VLAN, you should set the link type for the port according to its connected device. The link types of port including the following three types:

- (1) **ACCESS:** The ACCESS port can be added in a single VLAN, and the egress rule of the port is UNTAG. The PVID is same as the current VLAN ID. If the ACCESS port is added to another VLAN, it will be removed from the current VLAN automatically.
- (2) **TRUNK:** The TRUNK port can be added in multiple VLANs, and the egress rule of the port is TAG. The TRUNK port is generally used to connect the cascaded network devices for it can receive and forward the packets of multiple VLANs. When the packets are forwarded by the TRUNK port, its VLAN tag will not be changed.
- (3) **GENERAL:** The GENERAL port can be added in multiple VLANs and set various egress rules according to the different VLANs. The default egress rule is UNTAG. The PVID can be set as the VID number of any VLAN the port belongs to.

➤ PVID

PVID (Port Vlan ID) is the default VID of the port. When the switch receives an un-VLAN-tagged packet, it will add a VLAN tag to the packet according to the PVID of its received port and forward the packets.

When creating VLANs, the PVID of each port, indicating the default VLAN to which the port belongs, is an important parameter with the following two purposes:

- (1) When the switch receives an un-VLAN-tagged packet, it will add a VLAN tag to the packet according to the PVID of its received port
- (2) PVID determines the default broadcast domain of the port, i.e. when the port receives UL packets or broadcast packets, the port will broadcast the packets in its default VLAN.

Different packets, tagged or untagged, will be processed in different ways, after being received by ports of different link types, which is illustrated in the following table.

Port Type	Receiving Packets		Forwarding Packets
	Untagged Packets	Tagged Packets	
Access	When untagged packets are received, the port will add the default VLAN tag, i.e. the PVID of the ingress port, to the packets.	If the VID of packet is the same as the PVID of the port, the packet will be received. If the VID of packet is not the same as the PVID of the port, the packet will be dropped.	The packet will be forwarded after removing its VLAN tag.
Trunk		If the VID of packet is allowed by the port, the packet will be received. If the VID of packet is forbidden by the port, the packet will be dropped.	The packet will be forwarded with its current VLAN tag.
General			If the egress rule of port is TAG, the packet will be forwarded with its current VLAN tag. If the egress rule of port is UNTAG, the packet will be forwarded after removing its VLAN tag.

Table 6-1 Relationship between Port Types and VLAN Packets Processing

IEEE 802.1Q VLAN function is implemented on the **VLAN Config** and **Port Config** pages.

6.1.1 VLAN Config

On this page, you can view the current created 802.1Q VLAN.

Choose the menu **VLAN**→**802.1Q VLAN**→**VLAN Config** to load the following page.

VLAN Table				
Select	VLAN ID	Name	Members	Operation
<input type="checkbox"/>	1	Default VLAN	1-28	Edit Detail

VLAN ID

Total VLAN: 1

Figure 6-3 VLAN Table

To ensure the normal communication of the factory switch, the default VLAN of all ports is set to VLAN1.

The following entries are displayed on this screen:

➤ **VLAN Table**

- VLAN ID Select:** Click the **Select** button to quick-select the corresponding entry based on the VLAN ID number you entered.
- Select:** Select the desired entry to delete the corresponding VLAN. It is multi-optional.
- VLAN ID:** Displays the ID number of VLAN.
- Name:** Displays the user-defined name of VLAN.
- Members:** Displays the port members in the VLAN.
- Operation:** Allows you to view or modify the information for each entry.
 - **Edit:** Click to modify the settings of VLAN.
 - **Detail:** Click to get the information of VLAN.

Click **Edit** button to modify the settings of the corresponding VLAN. Click **Create** button to create a new VLAN.

VLAN Create

VLAN ID: (2-4094)

<input type="checkbox"/>	14	ACCESS	UNTAG	---

Note:
Link Type can be changed in Page 'Port Config'.

Figure 6-4 Create or Modify 802.1Q VLAN

The following entries are displayed on this screen:

➤ **VLAN Config**

- VLAN ID:** Enter the ID number of VLAN.
- Description:** Give a description to the VLAN for identification.
- Check:** Click the **Check** button to check whether the VLAN ID you entered is valid or not.

➤ **VLAN Members**

- Port Select:** Click the **Select** button to quick-select the corresponding entry based on the port number you entered.
- Select:** Select the desired port to be a member of VLAN or leave it blank. It's multi-optional.
- Port:** Displays the port number.
- Link Type:** Displays the Link Type of the port. It can be reset on Port Config screen.
- Egress Rule:** Select the Egress Rule for the VLAN port member. The default egress rule is UNTAG.
- **TAG:** All packets forwarded by the port are tagged. The packets contain VLAN information.
 - **UNTAG:** Packets forwarded by the port are untagged.
- LAG:** Displays the LAG to which the port belongs.

6.1.2 Port Config

Before creating the 802.1Q VLAN, please acquaint yourself with all the devices connected to the switch in order to configure the ports properly.

Choose the menu **VLAN**→**802.1Q VLAN**→**Port Config** to load the following page.

VLAN Port Config

Port

Figure 6-5 802.1Q VLAN – Port Config

The following entries are displayed on this screen:

➤ **VLAN Port Config**

Port Select: Click the **Select** button to quick-select the corresponding entry based on the port number you entered.

Select: Select the desired port for configuration. It is multi-optional.

Port: Displays the port number.

Link Type: Select the Link Type from the pull-down list for the port.

- **ACCESS:** The ACCESS port can be added in a single VLAN, and the egress rule of the port is UNTAG. The PVID is same as the current VLAN ID. If the current VLAN is deleted, the PVID will be set to 1 by default.
- **TRUNK:** The TRUNK port can be added in multiple VLANs, and the egress rule of the port is TAG. The PVID can be set as the VID number of any VLAN the port belongs to.
- **GENERAL:** The GENERAL port can be added in multiple VLANs and set various egress rules according to the different VLANs. The default egress rule is UNTAG. The PVID can be set as the VID number of any VLAN the port belongs to.

PVID: Enter the PVID number of the port.

LAG: Displays the LAG to which the port belongs.

VLAN: Click the **Detail** button to view the information of the VLAN to which the port belongs.

Click the **Detail** button to view the information of the corresponding VLAN.

VLAN of Port 1		
		VLAN ID <input type="text"/> <input type="button" value="Select"/>
VLAN ID	VLAN Name	Operation
1	Default VLAN	Remove

Note:

Total VLAN of Port 1: 1

Figure 6-6 View the Current VLAN of Port

The following entries are displayed on this screen:

➤ **VLAN of Port**

- VLAN ID Select:** Click the **Select** button to quick-select the corresponding entry based on the VLAN ID number you entered.
- VLAN ID:** Displays the ID number of VLAN.
- VLAN Name:** Displays the user-defined description of VLAN.
- Operation:** Allows you to remove the port from the current VLAN.

Configuration Procedure:

Step	Operation	Description
1	Set the link type for port.	Required. On the VLAN→802.1Q VLAN→Port Config page, set the link type for the port basing on its connected device.
2	Create VLAN.	Required. On the VLAN→802.1Q VLAN→VLAN Config page, click the Create button to create a VLAN. Enter the VLAN ID and the description for the VLAN. Meanwhile, specify its member ports.
3	Modify/View VLAN.	Optional. On the VLAN→802.1Q VLAN→VLAN Config page, click the Edit/Detail button to modify/view the information of the corresponding VLAN.
4	Delete VLAN	Optional. On the VLAN→802.1Q VLAN→VLAN Config page, select the desired entry to delete the corresponding VLAN by clicking the Delete button.

6.2 MAC VLAN

MAC VLAN technology is the way to classify VLANs according to the MAC addresses of Hosts. A MAC address corresponds to a single VLAN ID. For the device in a MAC VLAN, if its MAC address is bound to VLAN, the device can be connected to another member port in this VLAN and still takes its member role effect without changing the configuration of VLAN members.

The packet in MAC VLAN is processed in the following way:

1. When receiving an untagged packet, the switch matches the packet with the current MAC VLAN. If the packet is matched, the switch will add a corresponding MAC VLAN tag to it. If no MAC VLAN is matched, the switch will add a tag to the packet according to the PVID of the

received port. Thus, the packet is assigned automatically to the corresponding VLAN for transmission.

2. When receiving tagged packet, the switch will process it basing on the 802.1Q VLAN. If the received port is the member of the VLAN to which the tagged packet belongs, the packet will be forwarded normally. Otherwise, the packet will be discarded.
3. If the MAC address of a Host is classified into 802.1Q VLAN, please set its connected port of switch to be a member of this 802.1Q VLAN so as to ensure the packets forwarded normally.

6.2.1 MAC VLAN

On this page, you can create MAC VLAN and view the current MAC VLANs in the table.

Choose the menu **VLAN**→**MAC VLAN** to load the following page.

Create MAC VLAN

MAC Address: (Format: 00-00-00-00-00-01)

Description: (8 characters maximum)

VLAN ID: (1-4094)

MAC VLAN Table

MAC Address

Select	MAC Address	Description	VLAN ID	Operation
No entry in the MAC VLAN table.				

Figure 6-7 Create and View MAC VLAN

The following entries are displayed on this screen:

➤ **VLAN Table**

MAC Address: Enter the MAC address.

Description: Give a description to the MAC address for identification.

VLAN ID: Enter the ID number of the MAC VLAN. This VLAN should be one of the 802.1Q VLANs the ingress port belongs to.

➤ **MAC VLAN Table**

MAC Select: Click the **Select** button to quick-select the corresponding entry based on the MAC address you entered.

Select: Select the desired entry. It is multi-optional.

MAC Address: Displays the MAC address.

Description: Displays the user-defined description of the MAC address.

VLAN ID: Displays the corresponding VLAN ID of the MAC address.

Operation: Click the **Edit** button to modify the settings of the entry. And click the **Modify** button to apply your settings.

6.2.2 Port Enable

On this page, you can enable the port for the MAC VLAN feature. Only the port is enabled, can the configured MAC VLAN take effect.

Choose the menu **VLAN**→**MAC VLAN**→**Port Enable** to load the following page.

Port Enable					
<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4	<input type="checkbox"/> 5	<input type="checkbox"/> 6
<input type="checkbox"/> 7	<input type="checkbox"/> 8	<input type="checkbox"/> 9	<input type="checkbox"/> 10	<input type="checkbox"/> 11	<input type="checkbox"/> 12
<input type="checkbox"/> 13	<input type="checkbox"/> 14	<input type="checkbox"/> 15	<input type="checkbox"/> 16	<input type="checkbox"/> 17	<input type="checkbox"/> 18
<input type="checkbox"/> 19	<input type="checkbox"/> 20	<input type="checkbox"/> 21	<input type="checkbox"/> 22	<input type="checkbox"/> 23	<input type="checkbox"/> 24(LAG1)
<input type="checkbox"/> 25(LAG1)	<input type="checkbox"/> 26(LAG1)	<input type="checkbox"/> 27	<input type="checkbox"/> 28		

Figure 6-8 Enable MAC VLAN for Port

Select your desired port for VLAN Mapping function. All the ports are disabled for VLAN Mapping function by default.

Configuration Procedure:

Step	Operation	Description
1	Set the link type for port.	Required. On the VLAN → 802.1Q VLAN → Port Config page, set the link type for the port basing on its connected device.
2	Create VLAN.	Required. On the VLAN → 802.1Q VLAN → VLAN Config page, click the Create button to create a VLAN. Enter the VLAN ID and the description for the VLAN. Meanwhile, specify its member ports.
3	Create MAC VLAN.	Required. On the VLAN → MAC VLAN page, create the MAC VLAN. For the device in a MAC VLAN, it's required to set its connected port of switch to be a member of this VLAN so as to ensure the normal communication.
4	Select your desired ports for MAC VLAN feature.	Required. On the VLAN → MAC VLAN → Port Enable page, select and enable the desired ports for MAC VLAN feature.

6.3 Protocol VLAN

Protocol VLAN is another way to classify VLANs basing on network protocol. Protocol VLANs can be sorted by IP, IPX, DECnet, AppleTalk, Banyan and so on. Through the Protocol VLANs, the broadcast domain can span over multiple switches and the Host can change its physical position in the network with its VLAN member role always effective. By creating Protocol VLANs, the network administrator can manage the network clients basing on their actual applications and services effectively.

This switch can classify VLANs basing on the common protocol types listed in the following table. Please create the Protocol VLAN to your actual need.

Protocol Type	Type value
ARP	0x0806
IP	0x0800
MPLS	0x8847/0x8848

Protocol Type	Type value
IPX	0x8137
IS-IS	0x8000
LACP	0x8809
802.1X	0x888E

Table 6-2 Protocol types in common use

The packet in Protocol VLAN is processed in the following way:

1. When receiving an untagged packet, the switch matches the packet with the current Protocol VLAN. If the packet is matched, the switch will add a corresponding Protocol VLAN tag to it. If no Protocol VLAN is matched, the switch will add a tag to the packet according to the PVID of the received port. Thus, the packet is assigned automatically to the corresponding VLAN for transmission.
2. When receiving tagged packet, the switch will process it basing on the 802.1Q VLAN. If the received port is the member of the VLAN to which the tagged packet belongs, the packet will be forwarded normally. Otherwise, the packet will be discarded.
3. If the Protocol VLAN is created, please set its enabled port to be the member of corresponding 802.1Q VLAN so as to ensure the packets forwarded normally.

6.3.1 Protocol VLAN

On this page, you can create Protocol VLAN and view the information of the current defined Protocol VLANs.

Choose the menu **VLAN**→**Protocol VLAN**→**Protocol VLAN** to load the following page.

Create Protocol VLAN

Protocol:

VLAN ID: (1-4094)

Protocol VLAN Table

Select	Protocol	Ether Type	VLAN ID	Operation
No entry in the Protocol VLAN table.				

Figure 6-9 Create Protocol VLAN

The following entries are displayed on this screen:

➤ **Create Protocol VLAN**

Protocol: Select the defined protocol template.

VLAN ID: Enter the ID number of the Protocol VLAN. This VLAN should be one of the 802.1Q VLANs the ingress port belongs to.

➤ **Protocol VLAN Table**

- Select:** Select the desired entry. It is multi-optional.
- Protocol:** Displays the protocol template of the VLAN.
- Ether Type:** Displays the Ethernet protocol type field in the protocol template.
- VLAN ID:** Displays the corresponding VLAN ID of the protocol.
- Operation:** Click the **Edit** button to modify the settings of the entry. And click the **Modify** button to apply your settings.

6.3.2 Protocol Template

The Protocol Template should be created before configuring the Protocol VLAN. By default, the switch has defined the IP Template, ARP Template, RARP Template, etc. You can add more Protocol Template on this page.

Choose the menu **VLAN**→**Protocol VLAN**→**Protocol Template** to load the following page.

Create Protocol Template

Protocol Name: (8 characters maximum)

Ether Type: (4 Hex integers)

Select	ID	Protocol Name	Ether Type
<input type="checkbox"/>	1	IP	0800
<input type="checkbox"/>	2	ARP	0806
<input type="checkbox"/>	3	RARP	8035
<input type="checkbox"/>	4	IPX	8137
<input type="checkbox"/>	5	AT	809B

Figure 6-10 Create and View Protocol Template

The following entries are displayed on this screen:

➤ **Create Protocol Template**

- Protocol Name:** Give a name for the Protocol Template.
- Ether Type:** Enter the Ethernet protocol type field in the protocol template.

➤ **Protocol Template Table**

- Select:** Select the desired entry. It is multi-optional.
- Protocol Name:** Displays the name of the protocol template.
- Ether Type:** Displays the Ethernet protocol type field in the protocol template.

 **Note:**
The Protocol Template bound to VLAN can not be deleted.

6.3.3 Port Enable

On this page, you can enable the port for the Protocol VLAN feature. Only the port is enabled, can the configured Protocol VLAN take effect.

Choose the menu **VLAN**→**Protocol VLAN**→**Port Enable** to load the following page.

Port Enable					
<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4	<input type="checkbox"/> 5	<input type="checkbox"/> 6
<input type="checkbox"/> 7	<input type="checkbox"/> 8	<input type="checkbox"/> 9	<input type="checkbox"/> 10	<input type="checkbox"/> 11	<input type="checkbox"/> 12
<input type="checkbox"/> 13	<input type="checkbox"/> 14	<input type="checkbox"/> 15	<input type="checkbox"/> 16	<input type="checkbox"/> 17	<input type="checkbox"/> 18
<input type="checkbox"/> 19	<input type="checkbox"/> 20	<input type="checkbox"/> 21	<input type="checkbox"/> 22	<input type="checkbox"/> 23	<input type="checkbox"/> 24(LAG1)
<input type="checkbox"/> 25(LAG1)	<input type="checkbox"/> 26(LAG1)	<input type="checkbox"/> 27	<input type="checkbox"/> 28		

Figure 6-11 Enable Protocol VLAN for Port

Select your desired port for VLAN Mapping function. All the ports are disabled for VLAN Mapping function by default.

Configuration Procedure:

Step	Operation	Description
1	Set the link type for port.	Required. On the VLAN → 802.1Q VLAN → Port Config page, set the link type for the port basing on its connected device.
2	Create VLAN.	Required. On the VLAN → 802.1Q VLAN → VLAN Config page, click the Create button to create a VLAN. Enter the VLAN ID and the description for the VLAN. Meanwhile, specify its member ports.
3	Create Protocol Template.	Required. On the VLAN → Protocol VLAN → Protocol Template page, create the Protocol Template before configuring Protocol VLAN.
4	Select your desired ports for Protocol VLAN feature.	Required. On the VLAN → Protocol VLAN → Port Enable page, select and enable the desired ports for Protocol VLAN feature.
5	Create Protocol VLAN.	Required. On the VLAN → Protocol VLAN → Protocol VLAN page, select the protocol type and enter the VLAN ID to create a Protocol VLAN.
6	Modify/View VLAN.	Optional. On the VLAN → Protocol VLAN → Protocol VLAN page, click the Edit button to modify/view the information of the corresponding VLAN.
7	Delete VLAN.	Optional. On the VLAN → Protocol VLAN → Protocol VLAN page, select the desired entry to delete the corresponding VLAN by clicking the Delete button.

6.4 Application Example for 802.1Q VLAN

➤ Network Requirements

- Switch A is connecting to PC A and Server B;

- Switch B is connecting to PC B and Server A;
- PC A and Server A is in the same VLAN;
- PC B and Server B is in the same VLAN;
- PCs in the two VLANs cannot communicate with each other.

➤ **Network Diagram**

➤ **Configuration Procedure**

- Configure switch A

Step	Operation	Description
1	Configure the Link Type of the ports	Required. On VLAN→802.1Q VLAN→Port Config page, configure the link type of Port 2, Port 3 and Port 4 as ACCESS, TRUNK and ACCESS respectively
2	Create VLAN10	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 10, owning Port 2 and Port 3.
3	Create VLAN20	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 20, owning Port 3 and Port 4.

- Configure switch B

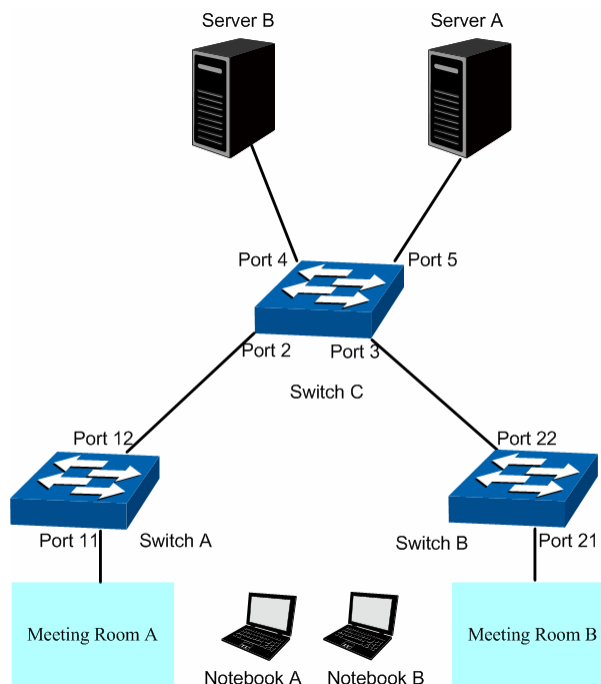

Step	Operation	Description
1	Configure the Link Type of the ports	Required. On VLAN→802.1Q VLAN→Port Config page, configure the link type of Port 7, Port 6 and Port 8 as ACCESS, TRUNK and ACCESS respectively.
2	Create VLAN10	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 10, owning Port 6 and Port 8.
3	Create VLAN20	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 20, owning Port 6 and Port 7.

6.5 Application Example for MAC VLAN

➤ Network Requirements

- Switch A and switch B are connected to meeting room A and meeting room B respectively, and the two rooms are for all departments;
- Notebook A and Notebook B, special for meeting room, are of two different departments;
- The two departments are in VLAN10 and VLAN20 respectively. The two notebooks can just access the server of their own departments, that is, Server A and Server B, in the two meeting rooms;
- The MAC address of Notebook A is 00-19-56-8A-4C-71, Notebook B's MAC address is 00-19-56-82-3B-70.

➤ Network Diagram

➤ Configuration Procedure

- Configure switch A

Step	Operation	Description
1	Configure the Link Type of the ports	Required. On VLAN→802.1Q VLAN→Port Config page, configure the link type of Port 11 and Port 12 as GENERAL and TRUNK respectively.
2	Create VLAN10	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 10, owning Port 11 and Port 12, and configure the egress rule of Port 11 as Untag.
3	Create VLAN20	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 20, owning Port 11 and Port 12, and configure the egress rule of Port 11 as Untag.

Step	Operation	Description
4	Configure MAC VLAN 10	On VLAN→MAC VLAN→MAC VLAN page, create MAC VLAN10 with the MAC address as 00-19-56-8A-4C-71.
5	Configure MAC VLAN 20	On VLAN→MAC VLAN→MAC VLAN page, create MAC VLAN10 with the MAC address as 00-19-56-82-3B-70.
6	Port Enable	Required. On the VLAN→MAC VLAN→Port Enable page, select and enable Port 11 and Port 12 for MAC VLAN feature.

- Configure switch B

Step	Operation	Description
1	Configure the Link Type of the ports	Required. On VLAN→802.1Q VLAN→Port Config page, configure the link type of Port 21 and Port 22 as GENERAL and TRUNK respectively.
2	Create VLAN10	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 10, owning Port 21 and Port 22, and configure the egress rule of Port 21 as Untag.
3	Create VLAN20	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 20, owning Port 21 and Port 22, and configure the egress rule of Port 21 as Untag.
4	Configure MAC VLAN 10	On VLAN→MAC VLAN→MAC VLAN page, create MAC VLAN10 with the MAC address as 00-19-56-8A-4C-71.
5	Configure MAC VLAN 20	On VLAN→MAC VLAN→MAC VLAN page, create MAC VLAN10 with the MAC address as 00-19-56-82-3B-70.
6	Port Enable	Required. On the VLAN→MAC VLAN→Port Enable page, select and enable Port 21 and Port 22 for MAC VLAN feature.

- Configure switch C

Step	Operation	Description
1	Configure the Link Type of the ports	Required. On VLAN→802.1Q VLAN→Port Config page, configure the link type of Port 2 and Port 3 as GENERAL, and configure the link type of Port 4 and Port 5 as ACCESS.
2	Create VLAN10	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 10, owning Port 2, Port 3 and Port 5,
3	Create VLAN20	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 20, owning Port 2, Port 3 and Port 4,

6.6 Application Example for Protocol VLAN

➤ Network Requirements

- Department A is connected to the company LAN via Port12 of switch A;
- Department A has IP host and AppleTalk host;

- IP host, in VLAN10, is served by IP server while AppleTalk host is served by AppleTalk server;
- Switch B is connected to IP server and AppleTalk server.

➤ **Network Diagram**

➤ **Configuration Procedure**

- Configure switch A

Step	Operation	Description
1	Configure the Link Type of the ports	Required. On VLAN→802.1Q VLAN→Port Config page, configure the link type of Port 11 and Port 13 as ACCESS, and configure the link type of Port 12 as GENERAL.
2	Create VLAN10	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 10, owning Port 12 and Port 13, and configure the egress rule of Port 12 as Untag.
3	Create VLAN20	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 20, owning Port 11 and Port 12, and configure the egress rule of Port 12 as Untag.

- Configure switch B

Step	Operation	Description
1	Configure the Link Type of the ports	Required. On VLAN→802.1Q VLAN→Port Config page, configure the link type of Port 4 and Port 5 as ACCESS, and configure the link type of Port 3 as GENERAL.
2	Create VLAN10	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 10, owning Port 3 and Port 4, and configure the egress rule of Port 3 as Untag.
3	Create VLAN20	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 20, owning Port 3 and Port 5, and configure the egress rule of Port 3 as Untag.

Step	Operation	Description
4	Create Protocol Template	Required. On VLAN→Protocol VLAN→Protocol Template page, configure the protocol template practically. E.g. the Ether Type of IP network packets is 0800 and that of AppleTalk network packets is 809B.
5	Port Enable	Required. On the VLAN→Protocol VLAN→Port Enable page, select and enable Port 3, Port 4 and Port 5 for Protocol VLAN feature.
6	Create Protocol VLAN 10	On VLAN→Protocol VLAN→Protocol VLAN page, create protocol VLAN 10 with Protocol as IP.
7	Create Protocol VLAN 20	On VLAN→Protocol VLAN→Protocol VLAN page, create protocol VLAN 20 with Protocol as AppleTalk.

6.7 VLAN VPN

With the increasing application of the Internet, the VPN (Virtual Private Network) technology is developed and used to establish the private network through the operators' backbone networks. VLAN-VPN (Virtual Private Network) function, the implement of a simple and flexible Layer 2 VPN technology, allows the packets with VLAN tags of private networks to be encapsulated with VLAN tags of public networks at the network access terminal of the Internet Service Provider. And these packets will be transmitted with double-tag across the public networks.

The VLAN-VPN function provides you with the following benefits:

- (1) Provides simple Layer 2 VPN solutions for small-sized MANs or intranets.
- (2) Saves public network VLAN ID resource.
- (3) You can have VLAN IDs of your own, which is independent of public network VLAN IDs.
- (4) When the network of the Internet Service Provider is upgraded, the user's network with a relative independence can still work normally without changing the current configurations.

In addition, the switch supports the feature to adjust the TPID Values of VLAN VPN Packets. TPID (Tag Protocol Identifier) is a field of the VLAN tag. IEEE 802.1Q specifies the value of TPID to be 0x8100. This switch adopts the default value of TPID (0x8100) defined by the protocol. Other manufacturers use other TPID values (such as 0x9100 or 0x9200) in the outer tags of VLAN-VPN packets. To be compatible with devices coming from other manufacturers, this switch can adjust the TPID values of VLAN-VPN packets globally. You can configure TPID values by yourself. When a port receives a packet, this port will replace the TPID value in the outer VLAN tag of this packet with the user-defined value and then send the packet again. Thus, the VLAN-VPN packets sent to the public network can be recognized by devices of other manufacturers.

The position of the TPID field in an Ethernet packet is the same as the position of the protocol type field in the packet without VLAN Tag. Thus, to avoid confusion happening when the switch forwards or receives a packet, you must not configure the following protocol type values listed in the following table as the TPID value.

Protocol type	Value
ARP	0x0806
IP	0x0800
MPLS	0x8847/0x8848
IPX	0x8137
IS-IS	0x8000

Protocol type	Value
LACP	0x8809
802.1X	0x888E

Table 6-3 Values of Ethernet frame protocol type in common use

This VLAN VPN function is implemented on the **VPN Config**, **VLAN Mapping** and **Port Enable** pages.

6.7.1 VPN Config

This page allows you to enable the VPN function, adjust the global TPID for VLAN-VPN packets and enable the VPN up-link port. When VPN mode is enabled, the switch will add a tag to the received tagged packet basing on the VLAN mapping entries.

Choose the menu **VLAN**→**VLAN VPN**→**VPN Config** to load the following page.

Figure 6-12 VPN Global Config

The following entries are displayed on this screen:

➤ Global Config

VPN Mode: Allows you to Enable/Disable the VLAN-VPN function.

Global TPID: Enter the global TPID (Tag protocol identifier).

➤ VPN Up-link Ports

Select the desired port as the VPN Up-link port. It's required to set the port connected to the operators' backbone networks to be up-link port.

Note:

If VPN mode is enabled, please create VLAN Mapping entries on the VLAN Mapping function page.

6.7.2 VLAN Mapping

VLAN Mapping function allows the VLAN TAG of the packets to be replaced with the new VLAN TAG according to the VLAN Mapping entries. And these packets can be forwarded in the new VLAN. If VLAN VPN function is enabled, a received packet already carrying a VLAN tag will be tagged basing on the VLAN Mapping entries and becomes a double-tagged packet to be forwarded in the new VLAN.

Choose the menu **VLAN**→**VLAN VPN**→**VLAN Mapping** to load the following page.

VLAN Mapping Config

C VLAN: (1-4094)

SP VLAN: (1-4094)

Description: (16 characters maximum)

Figure 6-14 Enable VLAN Mapping for Port

Select your desired port for VLAN Mapping function. All the ports are disabled for VLAN Mapping function by default.

Note:

When VPN mode is globally enabled, VPN function takes effect on all ports. If VPN mode is disabled, VLAN Mapping function can be enabled by selecting your desired port on this Port Enable page.

Configuration Procedure of VLAN VPN Function:

Step	Operation	Description
1	Enable VPN mode.	Required. On the VLAN→VLAN VPN→VPN Config page, enable the VPN mode.
2	Configure the global TPID.	Optional. On the VLAN→VLAN VPN→VPN Config page, configure the global TPID basing on the devices connected to the up-link port.
3	Set the VPN up-link port.	Required. On the VLAN→VLAN VPN→VPN Config page, specify the desired port to be the VPN up-link port. It's required to set the port connected to the backbone networks to be up-link port.
4	Create VLAN Mapping entries.	Required. On the VLAN→VLAN VPN→VLAN Mapping page, configure the VLAN Mapping entries basing on the actual application.
5	Create SP (Service Provider) VLAN.	Optional. On the VLAN→802.1Q VLAN page, create the SP VLAN. For the steps of creating VLAN, please refer to 802.1Q VLAN .

Configuration Procedure of VLAN Mapping Function:

Step	Operation	Description
1	Create VLAN Mapping entries.	Required. On the VLAN→VLAN VPN→VLAN Mapping page, configure the VLAN Mapping entries basing on the actual application.
2	Enable VLAN Mapping function for port.	Required. On the VLAN→VLAN VPN→Port Enable page, enable VLAN Mapping function for the ports.

Step	Operation	Description
3	Create SP (Service Provider) VLAN	Optional. On the VLAN—802.1Q VLAN page, create the SP VLAN. For the steps of creating VLAN, please refer to 802.1Q VLAN .

6.8 GVRP

GVRP (GARP VLAN Registration Protocol) is an implementation of GARP (generic attribute registration protocol). GVRP allows the switch to automatically add or remove the VLANs via the dynamic VLAN registration information and propagate the local VLAN registration information to other switches, without having to individually configure each VLAN.

> GARP

GARP provides the mechanism to assist the switch members in LAN to deliver, propagate and register the information among the members. GARP itself does not work as the entity among the devices. The application complied with GARP is called GARP implementation, and GVRP is the implementation of GARP. When GARP is implemented on a port of device, the port is called GARP entity.

The information exchange between GARP entities is completed by messages. GARP defines the messages into three types: Join, Leave and LeaveAll.

- **Join Message:** When a GARP entity expects other switches to register certain attribute information of its own, it sends out a Join message. And when receiving the Join message from the other entity or configuring some attributes statically, the device also sends out a Join message in order to be registered by the other GARP entities.
- **Leave Message:** When a GARP entity expects other switches to deregister certain attribute information of its own, it sends out a Leave message. And when receiving the Leave message from the other entity or deregistering some attributes statically, the device also sends out a Leave message.
- **LeaveAll Message:** Once a GARP entity starts up, it starts the LeaveAll timer. After the timer times out, the GARP entity sends out a LeaveAll message. LeaveAll message is to deregister all the attribute information so as to enable the other GARP entities to re-register attribute information of their own.

Through message exchange, all the attribute information to be registered can be propagated to all the switches in the same switched network.

The interval of GARP messages is controlled by timers. GARP defines the following timers:

- **Hold Timer:** When a GARP entity receives a piece of registration information, it does not send out a Join message immediately. Instead, to save the bandwidth resources, it starts the Hold timer, puts all registration information it receives before the timer times out into one Join message and sends out the message after the timer times out.
- **Join Timer:** To transmit the Join messages reliably to other entities, a GARP entity sends each Join message two times. The Join timer is used to define the interval between the two sending operations of each Join message.
- **Leave Timer:** When a GARP entity expects to deregister a piece of attribute information, it sends out a Leave message. Any GARP entity receiving this message starts its Leave timer, and deregisters the attribute information if it does not receives a Join message again before the timer times out.

- **LeaveAll Timer:** Once a GARP entity starts up, it starts the LeaveAll timer, and sends out a LeaveAll message after the timer times out, so that other GARP entities can re-register all the attribute information on this entity. After that, the entity restarts the LeaveAll timer to begin a new cycle.

➤ **GVRP**

GVRP, as an implementation of GARP, maintains dynamic VLAN registration information and propagates the information to other switches by adopting the same mechanism of GARP.

After the GVRP feature is enabled on a switch, the switch receives the VLAN registration information from other switches to dynamically update the local VLAN registration information, including VLAN members, ports through which the VLAN members can be reached, and so on. The switch also propagates the local VLAN registration information to other switches so that all the switching devices in the same switched network can have the same VLAN information. The VLAN registration information includes not only the static registration information configured locally, but also the dynamic registration information, which is received from other switches.

In this switch, only the port with TRUNK link type can be set as the GVRP application entity to maintain the VLAN registration information. GVRP has the following three port registration modes: Normal, Fixed, and Forbidden.

- **Normal:** In this mode, a port can dynamically register/deregister a VLAN and propagate the dynamic/static VLAN information.
- **Fixed:** In this mode, a port cannot register/deregister a VLAN dynamically. It only propagates static VLAN information. That is, the port in Fixed mode only permits the packets of its static VLAN to pass.
- **Forbidden:** In this mode, a port cannot register/deregister VLANs. It only propagates VLAN 1 information. That is, the port in Forbidden mode only permits the packets of the default VLAN (namely VLAN 1) to pass.

Choose the menu **VLAN**→**GVRP**→**GVRP Config** to load the following page.

Figure 6-15 GVRP Config

Note:

If the GVRP feature is enabled for a member port of LAG, please ensure all the member ports of this LAG are set to be in the same status and registration mode.

The following entries are displayed on this screen:

➤ **Global Config**

GVRP: Allows you to Enable/Disable the GVRP function.

➤ **Port Config**

Port Select: Click the **Select** button to quick-select the corresponding entry based on the port number you entered.

Select: Select the desired port for configuration. It is multi-optional.

Port: Displays the port number.

Status: Enable/Disable the GVRP feature for the port. The port type should be set to TRUNK before enabling the GVRP feature.

Registration Mode: Select the Registration Mode for the port.

- **Normal:** In this mode, a port can dynamically register/deregister a VLAN and propagate the dynamic/static VLAN information.
- **Fixed:** In this mode, a port cannot register/deregister a VLAN dynamically. It only propagates static VLAN information.
- **Forbidden:** In this mode, a port cannot register/deregister VLANs. It only propagates VLAN 1 information.

LeaveAll Timer: Once the LeaveAll Timer is set, the port with GVRP enabled can send a LeaveAll message after the timer times out, so that other GARP ports can re-register all the attribute information. After that, the LeaveAll timer will start to begin a new cycle. The LeaveAll Timer ranges from 1000 to 30000 centiseconds.

Join Timer: To guarantee the transmission of the Join messages, a GARP port sends each Join message two times. The Join Timer is used to define the interval between the two sending operations of each Join message. The Join Timer ranges from 20 to 1000 centiseconds.

Leave Timer: Once the Leave Timer is set, the GARP port receiving a Leave message will start its Leave timer, and deregister the attribute information if it does not receive a Join message again before the timer times out. The Leave Timer ranges from 60 to 3000 centiseconds.

LAG: Displays the LAG to which the port belongs.

Note:

LeaveAll Timer $\geq 10 \times$ Leave Timer, Leave Timer $\geq 2 \times$ Join Timer

Configuration Procedure:

Step	Operation	Description
1	Set the link type for port.	Required. On the VLAN→802.1Q VLAN→Port Config page, set the link type of the port to be TRUNK.
2	Enable GVRP function.	Required. On the VLAN→GVRP page, enable GVRP function.
3	Configure the registration mode and the timers for the port.	Required. On the VLAN→GVRP page, configure the parameters of ports basing on actual applications.

6.9 Private VLAN

Private VLANs, designed to save VLAN resources of uplink devices and decrease broadcast, are sets of VLAN pairs that share a common primary identifier. To guarantee user information security, the ease with which to manage and account traffic for service providers, in campus network, service providers usually require that each individual user is layer-2 separated. VLAN feature can solve this problem. However, as stipulated by IEEE 802.1Q protocol, a device can only support up to 4094 VLANs. If a service provider assigns one VLAN per user, the VLANs will be far from enough; as a result, the number of users this service provider can support is limited.

Private VLAN adopts Layer 2 VLAN structure. A Private VLAN consists of a Primary VLAN and a Secondary VLAN, providing a mechanism for achieving layer-2-separation between ports. For uplink devices, all the packets received from the downstream are without VLAN tags. Uplink devices need to identify Primary VLANs but not Secondary VLANs. Therefore, they can save VLAN resources without considering the VLAN configuration in the lower layer. Meanwhile, the service provider can assign each user an individual Secondary VLAN, so that users are separated at the Layer 2 level.

Private VLAN technology is mainly used in campus or enterprise networks to achieve user layer-2-separation and to save VLAN resources of uplink devices.

➤ **The Elements of a Private VLAN**

Primary VLAN: A Private VLAN has one Primary VLAN and one Secondary VLAN. Primary VLAN is the user VLAN uplink device can identify but it is not the actual VLAN the end user is in. Every port in a private VLAN is a member of the primary VLAN. The primary VLAN carries unidirectional traffic downstream from the promiscuous ports to the host ports and to other promiscuous ports.

Secondary VLAN: Secondary VLAN is the actual VLAN the end user is in. Secondary VLANs are associated with a primary VLAN, and are used to carry traffic from hosts to uplink devices.

Promiscuous: A promiscuous port connects to and communicates with the uplink device. The PVID of the promiscuous port is the same with the Primary VLAN ID. One promiscuous port can only join to one Primary VLAN.

Host: A host port connects to and communicates with terminal device. The PVID of the host port is the same as the Secondary VLAN ID. One host port can only belong to one Private VLAN.

➤ **Features of Private VLAN**

1. A Private VLAN contains one Primary VLAN and one Secondary VLAN.
2. A VLAN can not be set as the Primary VLAN and Secondary VLAN simultaneously.
3. A Secondary VLAN can only join one private VLAN.
4. A Primary VLAN can be associated with multi-Secondary VLANs to create multi-Private VLANs.

➤ **Private VLAN Implementation**

To hide Secondary VLANs from uplink devices and save VLAN resources, Private VLAN containing one Primary VLAN and one Secondary VLAN requires the following characteristics:

- Packets from different Secondary VLANs can be forwarded to the uplink device via promiscuous port and carry no corresponding Secondary VLAN information.
- Packets from Primary VLANs can be sent to end users via host port and carry no Primary VLAN information.

Private VLAN is designed to save VLAN resource by means of Port configuration synchronization among the MAC address tables of VLANs and MAC address duplication. To achieve these requirements described above, the following two aspects are required:

- 1) Create Private VLAN: A Private VLAN includes one Primary VLAN and one Secondary VLAN, the PVID of the promiscuous port is equal to the Primary VLAN ID and the PVID of the host port is the same as the corresponding Secondary VLAN ID, moreover, the egress rule of all ports is untag by default, that is, only those untagged packets can be forwarded, but you can modify the egress rule on **VLAN**→**802.1Q VLAN**→**VLAN Config** page.

2) Port configuration and MAC address duplication should be synchronized on the switch. Port configuration synchronization is completed in the whole configuration progress and MAC address duplication is implemented while FDB is changing.

- Port configuration synchronization: when configuring promiscuous and host ports for a Private VLAN, the system will automatically add the promiscuous port and the host port synchronously to the corresponding Primary VLAN and Secondary VLAN. Through port configuration synchronization, the promiscuous port forwards the packets from the Primary VLAN as well as from all the Primary VLAN-associated Secondary VLANs; the host port forwards the packets from the Primary VLAN and the Secondary VLAN owning this host port.

Here we take a Private VLAN to illustrate port configuration synchronization. As shown in the figure below, Port2, Port3 and Port5 belong to VLAN 2, VLAN 3 and VLAN 5 respectively. Configure VLAN 2 and VLAN 3 as Secondary VLANs, and VLAN5 as Primary VLAN. After this configuration is completed, the settings of these ports are changed as shown in Table 6-5.

Figure 6-16

Port	PVID	Allowed VLANs
Port5	5	VLAN5
Port2	2	VLAN2
Port3	3	VLAN3

Table 6-4 Port settings before configuration synchronization

Port	PVID	Allowed VLANs
Port5	5	VLAN2, 3, 5
Port2	2	VLAN2, 5
Port3	3	VLAN2, 5

Table 6-5 Port settings after configuration synchronization

- **MAC address duplication:** After port configuration synchronization, packets from Secondary VLAN can be forwarded via the promiscuous port untagged, and those from Primary VLAN can be sent via the host port untagged. In order for these packets can be forwarded in unicast via the right port, MAC address duplication is used to expand the VLANs the MAC address is in. Normally, the egress ports for forwarding these packets are identified through MAC address learning. For example the switch in Figure 6-16 maintains a MAC address table shown in Table 6-6. The MAC address duplication process has two aspects, that is, duplicating the dynamic MAC addresses learned by the host ports in the secondary VLANs to the Primary VLAN and copying the dynamic MAC addresses learned by the promiscuous ports in the Primary VLAN to the secondary VLANs. As shown in Figure 6-16, supposing the Router sends a packet with the source MAC as mac_2 and the destination Mac as mac_a. The MAC address table on the switch is changed to the one shown in Table 6-7.

Destination MAC	VLAN	Egress Port
mac_a	5	port 5
mac_2	2	port 2
mac_3	3	port 3

Table 6-6 MAC address table before duplication

Destination MAC	VLAN	Egress Port
mac_a	5	port 5
mac_a	2	port 5
mac_a	3	port 5
mac_2	2	port 2
mac_2	5	port 2
mac_3	3	port 3
mac_3	5	port 3

Table 6-7 MAC address table after duplication

➤ **Packet forwarding in Private VLAN**

The Private VLAN packet forwarding process (here we take traffic transmission for PC2) based on the figure above is illustrated as follows:

- 1) PC2 sends out its first upstream packet with the source MAC as mac_2 and the destination MAC as mac_a. This packet is untagged.
- 2) When the host port Port2 on the switch receives this packet, it adds a default VLAN ID 2 to this packet and learns its source MAC address. The MAC address entry, mac_2+VLAN2+Port2 is created, indicating that the egress port for the traffic with destination MAC address mac_2 and VLAN ID 2 is Port2.
- 3) According to the MAC address duplication, this MAC address entry is copied to VLAN 5, and the switch adds the MAC address entry mac_2+VLAN5+Port2 to its address table.
- 4) As mac_a is not in the MAC address table of the switch, the switch will broadcast this packet in VLAN 2.
- 5) As the switch has performed the port configuration synchronization, Port5 can receive this packet from VLAN 2 and forward it to the Router untagged.
- 6) The Router responds to the switch upon receiving this packet.
- 7) When the promiscuous port Port5 receives the response packet, it tags this packet a default VLAN ID 5 and learns the MAC address entry mac_a+VLAN5+Port5.
- 8) According to the MAC address duplication, this MAC address entry is copied to VLAN 2 and VLAN 3, and the switch adds two more MAC address entries mac_a+VLAN2+Port5 and mac_a+VLAN3+Port5 to its address table.
- 9) The switch looks up the MAC address table based on mac_2+VLAN5. It finds out the egress port Port2 through which the packet is forwarded to PC2 untagged.

After all the steps above are finished, the bidirectional communication between PC2 and the Router is achieved.

Private VLAN functions are implemented on the **PVLAN Config** and **Port Config** pages.

6.9.1 PVLAN Config

On this page, you can create Private VLAN and view the information of the current defined Private VLANs.

Choose the menu **VLAN**→**Private VLAN**→**PVLAN Config** to load the following page.

Create Private VLAN

Primary VLAN: (2-4094)

Secondary VLAN: (Format:2,4-5,8)

Search Option

Search Option:

Private VLAN Table

Select	Primary VLAN	Secondary VLAN	Port
<input type="checkbox"/>			

Total Private VLAN:0

Note:
It's recommended to create less than 10 Private VLANs at a time.

Figure 6-17 Create Private VLAN

The following entries are displayed on this screen:

➤ **Create Private VLAN**

Primary VLAN: Enter the ID number of the Primary VLAN.

Secondary VLAN: Enter the ID number of the Secondary VLAN.

➤ **Search Option**

Search Option: Select a Search Option from the pull-down list and click the **Search** button to find your desired entry in Private VLAN.

- **Primary VLAN ID:** Enter the Primary VLAN ID number of the desired Private VLAN.
- **Secondary VLAN ID:** Enter the Secondary VLAN ID number of the desired Private VLAN.

➤ **Private VLAN Table**

Select: Select the entry to delete. It is multi-optional.

Primary VLAN: Displays the Primary VLAN ID number of the Private VLAN.

Secondary VLAN: Displays the Secondary VLAN ID number of the Private VLAN.

Port: Displays the Port number of the Private VLAN.

6.9.2 Port Config

The Private VLAN provides two Port Types for the ports, Promiscuous and Host. Usually, the Promiscuous port is used to connect to uplink devices while the Host port is used to connect to the terminal hosts, such as PC and Server.

Choose the menu **VLAN**→**Private VLAN**→**Port Config** to load the following page.

Port Config

Port:	<input type="text" value="Port1"/>		
Port Type:	<input type="text" value="Promiscuous"/>		<input type="button" value="Add"/>
Primary VLAN:	<input type="text"/>	(2-4094)	<input type="button" value="Help"/>
Secondary VLAN:	<input type="text"/>	(2-4094)	

Private VLAN Port Table

Port ID	Port Type	Operation

Figure 6-18 Create and View Protocol Template

The following entries are displayed on this screen:

➤ **Port Config**

- Port:** Select the desired port for configuration.
- Port Type:** Select the Port Type from the pull-down list for the port.
- Primary VLAN:** Specify the Primary VLAN the port belongs to.
- Secondary VLAN:** Specify the Secondary VLAN the port belongs to.

➤ **Private VLAN Port Table**

- Port ID:** Displays the port number.
- Port Type:** Displays the corresponding Port Type.
- Operation:** Click **Remove** to delete the port.

Note:

1. A Host Port can only join to a Private VLAN.
2. A Promiscuous Port can only join to a Primary VLAN.
3. If you want to add a Promiscuous port to different Private VLANs with the same Primary VLAN, you need to add the Promiscuous port to any one of these Private VLANs.

Configuration Procedure:

Step	Operation	Description
1	Create Private VLAN.	Required. On the VLAN→Private VLAN→PVLAN Config page, Enter the Primary VLAN and Secondary VLAN, and then click the Create button.
2	Add ports to Private VLAN	Required. On the VLAN→Private VLAN→Port Config page, select the desired ports and configure the port types and click the Add button.
3	Modify VLAN.	Optional. On the VLAN→Private VLAN→PVLAN Config page, select the desired Private VLAN and do the modification, then click the Apply button to modify the information of the corresponding VLAN.

Step	Operation	Description
4	Delete VLAN.	Optional. On the VLAN→Private VLAN→PVLAN Config page, select the desired entry to delete the corresponding VLAN by clicking the Delete button.

6.10 Application Example for Private VLAN

➤ Network Requirements

- Switch A is connecting to switch B, switch B is connecting to switch C;
- Switch B is connecting to PC1, PC2 and PC3;
- Switch C is connecting to PC4, PC5 and PC6;
- PCs in different VLANs cannot communicate with each other;;
- For switch A, packets from switch B and switch C have no VLAN tags. Switch A needs not to consider the VLANs of switch B and switch C;

➤ Network Diagram

➤ Configuration Procedure

- Configure switch A

Step	Operation	Description
1	Create VLAN6	Required. On VLAN→802.1Q VLAN→VLAN Config page, create a VLAN with its VLAN ID as 6, owning Port 1.

- Configure switch B

Step	Operation	Description
1	Create Private VLANs.	Required. On the VLAN→Private VLAN→PVLAN Config page, Enter the Primary VLAN 6 and Secondary VLAN 2-3, and then click the Create button.

Step	Operation	Description
2	Add Promiscuous port to Private VLANs	Required. On the VLAN→Private VLAN→Port Config page, configure the port type of Port3 and Port4 as Promiscuous , enter Primary VLAN 6 and Secondary VLAN 2-3, and click the Add button.
3	Add Host port to Private VLANs	Required. On the VLAN→Private VLAN→Port Config page, configure the port type of Port5 as Host , enter Primary VLAN 6 and Secondary VLAN 2, and click the Add button. Configure the port type of Port6 and Port7 as Host , enter Primary VLAN 6 and Secondary VLAN 3, and click the Add button
4	Configure Port4	Required. On the VLAN→802.1Q VLAN→VLAN Config page, click the Edit button and then configure the Egress Rule of Port4 as Tag .

- Configure switch C

Step	Operation	Description
1	Create Private VLANs.	Required. On the VLAN→Private VLAN→PVLAN Config page, Enter the Primary VLAN 6 and Secondary VLAN 2-3, and then click the Create button.
2	Add Promiscuous port to Private VLANs	Required. On the VLAN→Private VLAN→Port Config page, configure the port type of Port8 as Promiscuous , enter Primary VLAN 6 and Secondary VLAN 2-3, and click the Add button.
3	Add Host port to Private VLANs	Required. On the VLAN→Private VLAN→Port Config page, configure the port type of Port9 as Host , enter Primary VLAN 6 and Secondary VLAN 2, and click the Add button. Configure the port type of Port10 and Port11 as Host , enter Primary VLAN 6 and Secondary VLAN 2-3, and click the Add button
4	Configure Port8	Required. On the VLAN→802.1Q VLAN→VLAN Config page, click the Edit button and then configure the Egress Rule of Port8 as Tag .

[Return to CONTENTS](#)

Chapter 7 Spanning Tree

STP (Spanning Tree Protocol), subject to IEEE 802.1D standard, is to disbranch a ring network in the Data Link layer in a local network. Devices running STP discover loops in the network and block ports by exchanging information, in that way, a ring network can be disbranched to form a tree-topological ring-free network to prevent packets from being duplicated and forwarded endlessly in the network.

BPDU (Bridge Protocol Data Unit) is the protocol data that STP and RSTP use. Enough information is carried in BPDU to ensure the spanning tree generation. STP is to determine the topology of the network via transferring BPDUs between devices.

To implement spanning tree function, the switches in the network transfer BPDUs between each other to exchange information and all the switches supporting STP receive and process the received BPDUs. BPDUs carry the information that is needed for switches to figure out the spanning tree.

> STP Elements

Bridge ID (Bridge Identifier) : Indicates the value of the priority and MAC address of the bridge. Bridge ID can be configured and the switch with the lower bridge ID has the higher priority.

Root Bridge: Indicates the switch has the lowest bridge ID. Configure the best PC in the ring network as the root bridge to ensure best network performance and reliability.

Designated Bridge: Indicates the switch has the lowest path cost from the switch to the root bridge in each network segment. BPDUs are forwarded to the network segment through the designated bridge. The switch with the lowest bridge ID will be chosen as the designated bridge.

Root Path Cost: Indicates the sum of the path cost of the root port and the path cost of all the switches that packets pass through. The root path cost of the root bridge is 0.

Bridge Priority: The bridge priority can be set to a value in the range of 0~61440. The lower value priority has the higher priority. The switch with the higher priority has more chance to be chosen as the root bridge.

Root Port: Indicates the port that has the lowest path cost from this bridge to the Root Bridge and forwards packets to the root.

Designated Port: Indicates the port that forwards packets to a downstream network segment or switch.

Port Priority: The port priority can be set to a value in the range of 0~255. The lower value priority has the higher priority. The port with the higher priority has more chance to be chosen as the root port.

Path Cost: Indicates the parameter for choosing the link path by STP. By calculating the path cost, STP chooses the better links and blocks the redundant links so as to disbranch the ring-network to form a tree-topological ring-free network.

The following network diagram shows the sketch map of spanning tree. Switch A, B and C are connected together in order. After STP generation, switch A is chosen as root bridge, the path from port 2 to port 6 is blocked.

- Bridge: Switch A is the root bridge in the whole network; switch B is the designated bridge of switch C.
- Port: Port 3 is the root port of switch B and port 5 is the root port of switch C; port 1 is the designated port of switch A and port 4 is the designated port of switch B; port 6 is the blocked port of switch C.

Figure 7-1 Basic STP diagram

➤ STP Timers

Hello Time:

Hello Time ranges from 1 to 10 seconds. It specifies the interval to send BPDU packets. It is used to test the links.

Max. Age:

Max. Age ranges from 6 to 40 seconds. It specifies the maximum time the switch can wait without receiving a BPDU before attempting to reconfigure.

Forward Delay:

Forward Delay ranges from 4 to 30 seconds. It specifies the time for the port to transit its state after the network topology is changed.

When the STP regeneration caused by network malfunction occurs, the STP structure will get some corresponding change. However, as the new configuration BPDUs cannot be spread in the whole network at once, the temporal loop will occur if the port transits its state immediately. Therefore, STP adopts a state transit mechanism, that is, the new root port and the designated port begins to forward data after twice forward delay, which ensures the new configuration BPDUs are spread in the whole network.

➤ BPDU Comparing Principle in STP mode

Assuming two BPDUs: BPDU X and BPDU Y

If the root bridge ID of X is smaller than that of Y, X is superior to Y.

If the root bridge ID of X equals that of Y, but the root path cost of X is smaller than that of Y, X is superior to Y.

If the root bridge ID and the root path cost of X equal those of Y, but the bridge ID of X is smaller than that of Y, X is superior to Y.

If the root bridge ID, the root path cost and bridge ID of X equal those of Y, but the port ID of X is smaller than that of Y, X is superior to Y.

➤ STP Generation

● In the beginning

In the beginning, each switch regards itself as the root, and generates a configuration BPDU for each port on it as a root, with the root path cost being 0, the ID of the designated bridge being that of the switch, and the designated port being itself.

● Comparing BPDUs

Each switch sends out configuration BPDUs and receives a configuration BPDU on one of its ports from another switch. The following table shows the comparing operations.

Step	Operation
1	If the priority of the BPDU received on the port is lower than that of the BPDU if of the port itself, the switch discards the BPDU and does not change the BPDU of the port.
2	If the priority of the BPDU is higher than that of the BPDU of the port itself, the switch replaces the BPDU of the port with the received one and compares it with those of other ports on the switch to obtain the one with the highest priority.

Table 7-1 Comparing BPDUs

- Selecting the root bridge

The root bridge is selected by BPDU comparing. The switch with the smallest root ID is chosen as the root bridge.

- Selecting the root port and designate port

The operation is taken in the following way:

Step	Operation
1	For each switch (except the one chosen as the root bridge) in a network, the port that receives the BPDU with the highest priority is chosen as the root port of the switch.
2	Using the root port BPDU and the root path cost, the switch generates a designated port BPDU for each of its ports. <ul style="list-style-type: none"> ● Root ID is replaced with that of the root port; ● Root path is replaced with the sum of the root path cost of the root port and the path cost between this port and the root port; ● The ID of the designated bridge is replaced with that of the switch; ● The ID of the designated port is replaced with that of the port.
3	The switch compares the resulting BPDU with the BPDU of the desired port whose role you want to determine. <ul style="list-style-type: none"> ● If the resulting BPDU takes the precedence over the BPDU of the port, the port is chosen as the designated port and the BPDU of this port is replaced with the resulting BPDU. The port regularly sends out the resulting BPDU; ● If the BPDU of this port takes the precedence over the resulting BPDU, the BPDU of this port is not replaced and the port is blocked. The port only can receive BPDUs.

Table 7-2 Selecting root port and designated port

Tips:

In an STP with stable topology, only the root port and designated port can forward data, and the other ports are blocked. The blocked ports only can receive BPDUs.

RSTP (Rapid Spanning Tree Protocol), evolved from the 802.1D STP standard, enable Ethernet ports to transit their states rapidly. The premises for the port in the RSTP to transit its state rapidly are as follows.

- The condition for the root port to transit its port state rapidly: The old root port of the switch stops forwarding data and the designated port of the upstream switch begins to forward data.
- The condition for the designated port to transit its port state rapidly: The designated port is an edge port or connecting to a point-to-point link. If the designated port is an edge port, it can directly transit to forwarding state; if the designated port is connecting to a

point-to-point link, it can transit to forwarding state after getting response from the downstream switch through handshake.

➤ RSTP Elements

Edge Port: Indicates the port connected directly to terminals.

P2P Link: Indicates the link between two switches directly connected.

MSTP (Multiple Spanning Tree Protocol), compatible with both STP and RSTP and subject to IEEE 802.1s standard, not only enables spanning trees to converge rapidly, but also enables packets of different VLANs to be forwarded along their respective paths so as to provide redundant links with a better load-balancing mechanism.

Features of MSTP:

- MSTP combines VLANs and spanning tree together via VLAN-to-instance mapping table. It binds several VLANs to an instance to save communication cost and network resources.
- MSTP divides a spanning tree network into several regions. Each region has several internal spanning trees, which are independent of each other.
- MSTP provides a load-balancing mechanism for the packets transmission in the VLAN.
- MSTP is compatible with both STP and RSTP.

➤ MSTP Elements

MST Region (Multiple Spanning Tree Region): An MST Region comprises switches with the same region configuration and VLAN-to-Instances mapping relationship.

IST (Internal Spanning Tree): An IST is a spanning tree in an MST.

CST (Common Spanning Tree): A CST is the spanning tree in a switched network that connects all MST regions in the network.

CIST (Common and Internal Spanning Tree): A CIST, comprising IST and CST, is the spanning tree in a switched network that connects all switches in the network.

The following figure shows the network diagram in MSTP.

Figure 7-2 Basic MSTP diagram

➤ MSTP

MSTP divides a network into several MST regions. The CST is generated between these MST regions, and multiple spanning trees can be generated in each MST region. Each spanning trees is called an instance. As well as STP, MSTP uses BPDUs to generate spanning tree. The only difference is that the BPDU for MSTP carries the MSTP configuration information on the switches.

➤ Port States

In an MSTP, ports can be in the following four states:

- Forwarding: In this status the port can receive/forward data, receive/send BPDU packets as well as learn MAC address.
- Learning: In this status the port can receive/send BPDU packets and learn MAC address.
- Blocking: In this status the port can only receive BPDU packets.
- Disconnected: In this status the port is not participating in the STP.

➤ Port Roles

In an MSTP, the following roles exist:

- Root Port: Indicates the port that has the lowest path cost from this bridge to the Root Bridge and forwards packets to the root.
- Designated Port: Indicates the port that forwards packets to a downstream network segment or switch.
- Master Port: Indicates the port that connects a MST region to the common root. The path from the master port to the common root is the shortest path between this MST region and the common root.
- Alternate Port: Indicates the port that can be a backup port of a root or master port.
- Backup Port: Indicates the port that is the backup port of a designated port.
- Disabled: Indicates the port that is not participating in the STP.

The following diagram shows the different port roles.

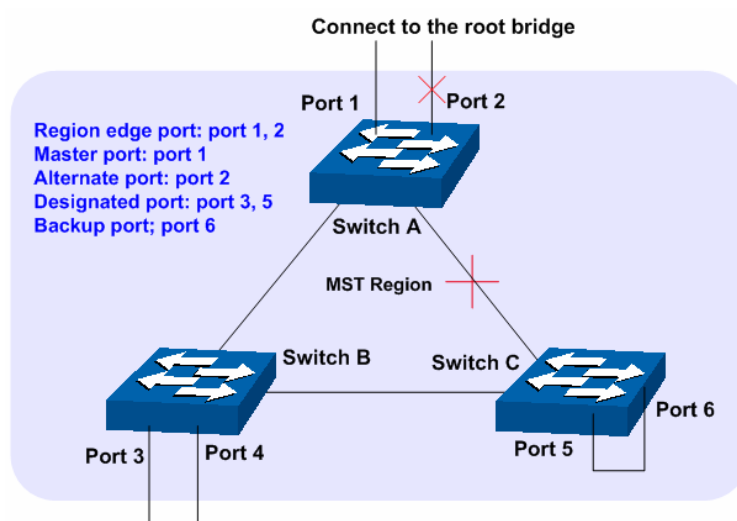

Figure 7-3 Port roles

The Spanning Tree module is mainly for spanning tree configuration of the switch, including four submenus: **STP Config**, **Port Config**, **MSTP Instance** and **STP Security**.

7.1 STP Config

The STP Config function, for global configuration of spanning trees on the switch, can be implemented on **STP Config** and **STP Summary** pages.

7.1.1 STP Config

Before configuring spanning trees, you should make clear the roles each switch plays in each spanning tree instance. Only one switch can be the root bridge in each spanning tree instance. On this page you can globally configure the spanning tree function and related parameters.

Choose the menu **Spanning Tree**→**STP Config**→**STP Config** to load the following page.

Global Config

STP: Enable Disable Apply

Version: STP ▼

Parameters Config

CIST Priority: 32768 (0-61440)

Hello Time: 2 sec (1-10)

Max Age: 20 sec (6-40) Apply

Forward Delay: 15 sec (4-30) Help

TxHoldCount: 5 pps (1-20)

Max Hops: 20 hop (1-40)

Figure 7-4 STP Config

The following entries are displayed on this screen:

➤ **Global Config**

STP: Select Enable/Disable STP function globally on the switch.

Version: Select the desired STP version on the switch.

- **STP:** Spanning Tree Protocol.
- **RSTP:** Rapid Spanning Tree Protocol.
- **MSTP:** Multiple Spanning Tree Protocol.

➤ **Parameters Config**

CIST Priority: Enter a value from 0 to 61440 to specify the priority of the switch for comparison in the CIST. CIST priority is an important criterion on determining the root bridge. In the same condition, the switch with the highest priority will be chosen as the root bridge. The lower value has the higher priority. The default value is 32768 and should be exact divisor of 4096.

Hello Time Enter a value from 1 to 10 in seconds to specify the interval to send BPDU packets. It is used to test the links. $2 * (\text{Hello Time} + 1) \leq \text{Max Age}$. The default value is 2 seconds.

Max Age: Enter a value from 6 to 40 in seconds to specify the maximum time the switch can wait without receiving a BPDU before attempting to reconfigure. The default value is 20 seconds.

Forward Delay: Enter a value from 4 to 30 in seconds to specify the time for the port to transit its state after the network topology is changed. $2 * (\text{Forward Delay} - 1) \geq \text{Max Age}$. The default value is 15 seconds.

TxHoldCount: Enter a value from 1 to 20 to set the maximum number of BPDU packets transmitted per Hello Time interval. The default value is 5pps.

Max Hops: Enter a value from 1 to 40 to set the maximum number of hops that occur in a specific region before the BPDU is discarded. The default value is 20 hops.

**Note:**

1. The forward delay parameter and the network diameter are correlated. A too small forward delay parameter may result in temporary loops. A too large forward delay may cause a network unable to resume the normal state in time. The default value is recommended.
2. An adequate hello time parameter can enable the switch to discover the link failures occurred in the network without occupying too much network resources. A too large hello time parameter may result in normal links being regarded as invalid when packets drop occurred in the links, which in turn result in spanning tree being regenerated. A too small hello time parameter may result in duplicated configuration being sent frequently, which increases the network load of the switches and wastes network resources. The default value is recommended.
3. A too small max age parameter may result in the switches regenerating spanning trees frequently and cause network congestions to be falsely regarded as link problems. A too large max age parameter result in the switches unable to find the link problems in time, which in turn handicaps spanning trees being regenerated in time and makes the network less adaptive. The default value is recommended.
4. If the TxHold Count parameter is too large, the number of MSTP packets being sent in each hello time may be increased with occupying too much network resources. The default value is recommended.

7.1.2 STP Summary

On this page you can view the related parameters for Spanning Tree function.

Choose the menu **Spanning Tree**→**STP Config**→**STP Summary** to load the following page.

STP Summary	
STP Status:	Disable
STP Version:	MSTP
Local Bridge:	32768---00-02-03-c0-9a-d3

<input type="checkbox"/>	14	Disable	128	Auto	Auto	Disable	Auto	---	---	---	---	LAG1
<input type="checkbox"/>	15	Disable	128	Auto	Auto	Disable	Auto	---	---	---	---	LAG1

Note:
If the Path Cost of a port is set to 0, it will alter automatically according to the port's link speed.

Figure 7-6 Port Config

The following entries are displayed on this screen:

➤ **Port Config**

- Port Select:** Click the **Select** button to quick-select the corresponding port based on the port number you entered.
- Select:** Select the desired port for STP configuration. It is multi-optional.
- Port:** Displays the port number of the switch.
- Status:** Select Enable /Disable STP function for the desired port.
- Priority:** Enter a value from 0 to 240 divisible by 16. Port priority is an important criterion on determining if the port connected to this port will be chosen as the root port. The lower value has the higher priority.
- ExtPath:** ExtPath Cost is used to choose the path and calculate the path costs of ports in different MST regions. It is an important criterion on determining the root port. The lower value has the higher priority.
- IntPath:** IntPath Cost is used to choose the path and calculate the path costs of ports in an MST region. It is an important criterion on determining the root port. The lower value has the higher priority.
- Edge Port:** Select Enable/Disable Edge Port. The edge port can transit its state from blocking to forwarding rapidly without waiting for forward delay.
- P2P Link:** Select the P2P link status. If the two ports in the P2P link are root port or designated port, they can transit their states to forwarding rapidly to reduce the unnecessary forward delay.
- MCheck:** Select Enable to perform MCheck operation on the port. Unchange means no MCheck operation.
- STP Version:** Displays the STP version of the port.
- Port Role:** Displays the role of the port played in the STP Instance.
- **Root Port:** Indicates the port that has the lowest path cost from this bridge to the Root Bridge and forwards packets to the root.
 - **Designated Port:** Indicates the port that forwards packets to a downstream network segment or switch.
 - **Master Port:** Indicates the port that connects a MST region to the common root. The path from the master port to the common root is the shortest path between this MST region and the common root.
 - **Alternate Port:** Indicates the port that can be a backup port of a root or master port.
 - **Backup Port:** Indicates the port that is the backup port of a designated port.
 - **Disabled:** Indicates the port that is not participating in the STP.
- Port Status:** Displays the working status of the port.
- **Forwarding:** In this status the port can receive/forward data, receive/send BPDU packets as well as learn MAC address.
 - **Learning:** In this status the port can receive/send BPDU packets and learn MAC address.
 - **Blocking:** In this status the port can only receive BPDU packets.
 - **Disconnected:** In this status the port is not participating in the STP.

LAG: Displays the LAG number which the port belongs to.

Note:

1. Configure the ports connected directly to terminals as edge ports and enable the BPDU protection function as well. This not only enables these ports to transit to forwarding state rapidly but also secures your network.
2. All the links of ports in a LAG can be configured as point-to-point links.
3. When the link of a port is configured as a point-to-point link, the spanning tree instances owning this port are configured as point-to-point links. If the physical link of a port is not a point-to-point link and you forcibly configure the link as a point-to-point link, temporary loops may be incurred.

7.3 MSTP Instance

MSTP combines VLANs and spanning tree together via VLAN-to-instance mapping table (VLAN-to-spanning-tree mapping). By adding MSTP instances, it binds several VLANs to an instance to realize the load balance based on instances.

Only when the switches have the same MST region name, MST region revision and VLAN-to-Instance mapping table, the switches can be regarded as in the same MST region.

The MSTP Instance function can be implemented on **Region Config**, **Instance Config** and **Instance Port Config** pages.

7.3.1 Region Config

On this page you can configure the name and revision of the MST region

Choose the menu **Spanning Tree**→**MSTP Instance**→**Region Config** to load the following page.

Region Config

Region Name:

Revision: (0-65535)

Apply

Help

Figure 7-7 Region Config

The following entries are displayed on this screen:

➤ **Region Config**

Region Name: Create a name for MST region identification using up to 32 characters.

Revision: Enter the revision from 0 to 65535 for MST region identification.

7.3.2 Instance Config

Instance Configuration, a property of MST region, is used to describe the VLAN to Instance mapping configuration. You can assign VLAN to different instances appropriate to your needs. Every instance is a VLAN group independent of other instances and CIST.

Choose the menu **Spanning Tree**→**MSTP Instance**→**Instance Config** to load the following page.

Instance Table						
					Instance ID <input type="text"/>	Select
Select	Instance	Status	Priority	VLAN ID		
<input type="checkbox"/>			<input type="text"/>	<input type="text"/>		
<input type="checkbox"/>	1	Disable	32768	Clear		
<input type="checkbox"/>	2	Disable	32768	Clear		
<input type="checkbox"/>	3	Disable	32768	Clear		
<input type="checkbox"/>	4	Disable	32768	Clear		
<input type="checkbox"/>	5	Disable	32768	Clear		
<input type="checkbox"/>	6	Disable	32768	Clear		
<input type="checkbox"/>	7	Disable	32768	Clear		
<input type="checkbox"/>	8	Disable	32768	Clear		
	CIST	Enable	32768	1-4094,		

VLAN-Instance Mapping

VLAN ID: (1-4094)

Instance ID: (0-8, 0 is the cist)

Note:

The format of input VLAN ID should be like '1, 3, 4-7, 11-30' in the range from 1 to 4094.

Figure 7-8 Instance Config

The following entries are displayed on this screen:

➤ **Instance Table**

Instance ID Select: Click the **Select** button to quick-select the corresponding Instance ID based on the ID number you entered.

Select: Select the desired Instance ID for configuration. It is multi-optional.

Instance: Displays Instance ID of the switch.

Status: Displays status of the instance.

Priority: Enter the priority of the switch in the instance. It is an important criterion on determining if the switch will be chosen as the root bridge in the specific instance.

VLAN ID: Enter the VLAN ID which belongs to the corresponding instance ID. After modification here, the previous VLAN ID will be cleared and mapped to the CIST.

Clear: Click the **Clear** button to clear up all VLAN IDs from the instance ID. The cleared VLAN ID will be automatically mapped to the CIST.

➤ **VLAN-Instance Mapping**

VLAN ID: Enter the desired VLAN ID. After modification here, the new VLAN ID will be added to the corresponding instance ID and the previous VLAN ID won't be replaced.

Instance ID: Enter the corresponding instance ID.

**Note:**

In a network with both GVRP and MSTP enabled, GVRP packets are forwarded along the CIST. If you want to broadcast packets of a specific VLAN through GVRP, please be sure to map the VLAN to the CIST when configuring the MSTP VLAN-instance mapping table. For detailed introduction of GVRP, please refer to **GVRP** function page.

7.3.3 Instance Port Config

A port can play different roles in different spanning tree instance. On this page you can configure the parameters of the ports in different instance IDs as well as view status of the ports in the specified instance.

Choose the menu **Spanning Tree**→**MSTP Instance**→**Instance Port Config** to load the following page.

Port Config

Instance ID: 1

Select	Port	Priority	Path Cost	Port Role	Port Status	LAG
<input type="checkbox"/>		<input type="text"/>	<input type="text"/>			
<input type="checkbox"/>	1	128	Auto	---	---	---
<input type="checkbox"/>	2	128	Auto	---	---	---
<input type="checkbox"/>	3	128	Auto	---	---	---
<input type="checkbox"/>	4	128	Auto	---	---	---
<input type="checkbox"/>	5	128	Auto	---	---	---
<input type="checkbox"/>	6	128	Auto	---	---	---
<input type="checkbox"/>	7	128	Auto	---	---	---
<input type="checkbox"/>	8	128	Auto	---	---	---
<input type="checkbox"/>	9	128	Auto	---	---	---
<input type="checkbox"/>	10	128	Auto	---	---	---
<input type="checkbox"/>	11	128	Auto	---	---	---
<input type="checkbox"/>	12	128	Auto	---	---	---
<input type="checkbox"/>	13	128	Auto	---	---	---
<input type="checkbox"/>	14	128	Auto	---	---	---
<input type="checkbox"/>	15	128	Auto	---	---	---

Note:

If the Path Cost of a port is set to 0, it will alter automatically according to the port's link speed.

Figure 7-9 Instance Port Config

The following entries are displayed on this screen:

➤ **Port Config**

- Instance ID:** Select the desired instance ID for its port configuration.
- Port Select:** Click the **Select** button to quick-select the corresponding port based on the port number you entered.
- Select:** Select the desired port to specify its priority and path cost. It is multi-optional.
- Port:** Displays the port number of the switch.

- Priority:** Enter the priority of the port in the instance. It is an important criterion on determining if the port connected to this port will be chosen as the root port.
- Path Cost:** Path Cost is used to choose the path and calculate the path costs of ports in an MST region. It is an important criterion on determining the root port. The lower value has the higher priority.
- Port Role:** Displays the role of the port played in the MSTP Instance.
- Port Status:** Displays the working status of the port.
- LAG:** Displays the LAG number which the port belongs to.

Note:

The port status of one port in different spanning tree instances can be different.

Global configuration Procedure for Spanning Tree function:

Step	Operation	Description
1	Make clear roles the switches play in spanning tree instances: root bridge or designated bridge	Preparation.
2	Globally configure MSTP parameters	Required. Enable Spanning Tree function on the switch and configure MSTP parameters on Spanning Tree → STP Config → STP Config page.
3	Configure MSTP parameters for ports	Required. Configure MSTP parameters for ports on Spanning Tree → Port Config → Port Config page.
4	Configure the MST region	Required. Create MST region and configure the role the switch plays in the MST region on Spanning Tree → MSTP Instance → Region Config and Instance Config page.
5	Configure MSTP parameters for instance ports	Optional. Configure different instances in the MST region and configure MSTP parameters for instance ports on Spanning Tree → MSTP Instance → Instance Port Config page.

7.4 STP Security

Configuring protection function for devices can prevent devices from any malicious attack against STP features. The STP Security function can be implemented on **Port Protect** and **TC Protect** pages.

Port Protect function is to prevent the devices from any malicious attack against STP features.

7.4.1 Port Protect

On this page you can configure loop protect feature, root protect feature, TC protect feature, BPDU protect feature and BPDU filter feature for ports. You are suggested to enable corresponding protection feature for the qualified ports.

➤ **Loop Protect**

In a stable network, a switch maintains the states of ports by receiving and processing BPDU packets from the upstream switch. However, when link congestions or link failures occurred to the network, a down stream switch does not receive BPDU packets for certain period, which results in spanning trees being regenerated and roles of ports being reselected, and causes the blocked ports to transit to forwarding state. Therefore, loops may be incurred in the network.

The loop protect function can suppresses loops. With this function enabled, a port, regardless of the role it plays in instances, is always set to blocking state, when the port does not receive BPDU packets from the upstream switch and spanning trees are regenerated, and thereby loops can be prevented.

➤ **Root Protect**

A CIST and its secondary root bridges are usually located in the high-bandwidth core region. Wrong configuration or malicious attacks may result in configuration BPDU packets with higher priorities being received by the legal root bridge, which causes the current legal root bridge to lose its position and network topology jitter to occur. In this case, flows that should travel along high-speed links may lead to low-speed links, and network congestion may occur.

To avoid this, MSTP provides root protect function. Ports with this function enabled can only be set as designated ports in all spanning tree instances. When a port of this type receives BPDU packets with higher priority, it transits its state to blocking state and stops forwarding packets (as if it is disconnected from the link). The port resumes the normal state if it does not receive any configuration BPDU packets with higher priorities for a period of two times of forward delay.

➤ **TC Protect**

A switch removes MAC address entries upon receiving TC-BPDU packets. If a user maliciously sends a large amount of TC-BPDU packets to a switch in a short period, the switch will be busy with removing MAC address entries, which may decrease the performance and stability of the network.

To prevent the switch from frequently removing MAC address entries, you can enable the TC protect function on the switch. With TC protect function enabled, if the account number of the received TC-BPDUs exceeds the maximum number you set in the TC threshold field, the switch will not performs the removing operation in the TC protect cycle. Such a mechanism prevents the switch from frequently removing MAC address entries.

➤ **BPDU Protect**

Ports of the switch directly connected to PCs or servers are configured as edge ports to rapidly transit their states. When these ports receive BPDUs, the system automatically configures these ports as non-edge ports and regenerates spanning trees, which may cause network topology jitter. Normally these ports do not receive BPDUs, but if a user maliciously attack the switch by sending BPDUs, network topology jitter occurs.

To prevent this attack, MSTP provides BPDU protect function. With this function enabled on the switch, the switch shuts down the edge ports that receive BPDUs and reports these cases to the administrator. If a port is shut down, only the administrator can restore it.

➤ **BPDU Filter**

BPDU filter function is to prevent BPDUs flood in the STP network. If a switch receives malicious BPDUs, it forwards these BPDUs to the other switched in the network, which may result in spanning trees being continuously regenerated. In this case, the switch occupying too much CPU or the protocol status of BPDUs is wrong.

With BPDU filter function enabled, a port does not receive or forward BPDUs, but it sends out its own BPDUs. Such a mechanism prevents the switch from being attacked by BPDUs so as to guarantee generation the spanning trees correct.

Choose the menu **Spanning Tree**→**STP Security**→**Port Protect** to load the following page.

Select	Port	Loop Protect	Root Protect	TC Protect	BPDU Protect	BPDU Filter	LAG
<input type="checkbox"/>		Disable	Disable	Disable	Disable	Disable	
<input type="checkbox"/>	1	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	2	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	3	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	4	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	5	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	6	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	7	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	8	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	9	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	10	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	11	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	12	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	13	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	14	Disable	Disable	Disable	Disable	Disable	---
<input type="checkbox"/>	15	Disable	Disable	Disable	Disable	Disable	---

Figure 7-10 Port Protect

The following entries are displayed on this screen:

➤ **Port Protect**

Port Select: Click the **Select** button to quick-select the corresponding port based on the port number you entered.

Select: Select the desired port for port protect configuration. It is multi-optional.

Port: Displays the port number of the switch.

Loop Protect: Loop Protect is to prevent the loops in the network brought by recalculating STP because of link failures and network congestions.

Root Protect: Root Protect is to prevent wrong network topology change caused by the role change of the current legal root bridge.

TC Protect: TC Protect is to prevent the decrease of the performance and stability of the switch brought by continuously removing MAC address entries upon receiving TC-BPDUs in the STP network.

BPDU Protect: BPDU Protect is to prevent the edge port from being attacked by maliciously created BPDUs

BPDU Filter: BPDU Filter is to prevent BPDUs flood in the STP network.

LAG: Displays the LAG number which the port belongs to.

7.4.2 TC Protect

When TC Protect is enabled for the port on **Port Protect** page, the TC threshold and TC protect cycle need to be configured on this page.

Choose the menu **Spanning Tree**→**STP Security**→**TC Protect** to load the following page.

TC Protect

TC Threshold: packet (1-100)

TC Protect Cycle: sec (1-10)

Apply

Help

Figure 7-11 TC Protect

The following entries are displayed on this screen:

➤ TC Protect

TC Threshold: Enter a number from 1 to 100. It is the maximum number of the TC-BPDUs received by the switch in a TC Protect Cycle. The default value is 20.

TC Protect Cycle: Enter a value from 1 to 10 to specify the TC Protect Cycle. The default value is 5.

7.5 Application Example for STP Function

➤ Network Requirements

- Switch A, B, C, D and E all support MSTP function.
- A is the central switch.
- B and C are switches in the convergence layer. D, E and F are switches in the access layer.
- There are 6 VLANs labeled as VLAN101-VLAN106 in the network.
- All switches run MSTP and belong to the same MST region.
- The data in VLAN101, 103 and 105 are transmitted in the STP with B as the root bridge. The data in VLAN102, 104 and 106 are transmitted in the STP with C as the root bridge.

➤ Network Diagram

➤ **Configuration Procedure**

- Configure switch A:

Step	Operation	Description
1	Configure ports	On VLAN → 802.1Q VLAN page, configure the link type of the related ports as Trunk, and add the ports to VLAN101-VLAN106. The detailed instructions can be found in the section 802.1Q VLAN .
2	Enable STP function	On Spanning Tree → STP Config → STP Config page, enable STP function and select MSTP version. On Spanning Tree → STP Config → Port Config page, enable MSTP function for the port.
3	Configure the region name and the revision of MST region	On Spanning Tree → MSTP Instance → Region Config page, configure the region as TP-LINK and keep the default revision setting.
4	Configure VLAN-to-Instance mapping table of the MST region	On Spanning Tree → MSTP Instance → Instance Config page, configure VLAN-to-Instance mapping table. Map VLAN 101, 103 and 105 to Instance 1; map VLAN 102, 104 and 106 to Instance 2.

- Configure switch B:

Step	Operation	Description
1	Configure ports	On VLAN → 802.1Q VLAN page, configure the link type of the related ports as Trunk, and add the ports to VLAN101-VLAN106. The detailed instructions can be found in the section 802.1Q VLAN .
2	Enable STP function	On Spanning Tree → STP Config → STP Config page, enable STP function and select MSTP version. On Spanning Tree → STP Config → Port Config page, enable MSTP function for the port.
3	Configure the region name and the revision of MST region	On Spanning Tree → MSTP Instance → Region Config page, configure the region as TP-LINK and keep the default revision setting.
4	Configure VLAN-to-Instance mapping table of the MST region	On Spanning Tree → MSTP Instance → Instance Config page, configure VLAN-to-Instance mapping table. Map VLAN 101, 103 and 105 to Instance 1; map VLAN 102, 104 and 106 to Instance 2.
5	Configure switch B as the root bridge of Instance 1	On Spanning Tree → MSTP Instance → Instance Config page, configure the priority of Instance 1 to be 0.
6	Configure switch B as the designated bridge of Instance 2	On Spanning Tree → MSTP Instance → Instance Config page, configure the priority of Instance 2 to be 4096.

- Configure switch C:

Step	Operation	Description
1	Configure ports	On VLAN → 802.1Q VLAN page, configure the link type of the related ports as Trunk, and add the ports to VLAN101-VLAN106. The detailed instructions can be found in the section 802.1Q VLAN .
2	Enable STP function	On Spanning Tree → STP Config → STP Config page, enable STP function and select MSTP version. On Spanning Tree → STP Config → Port Config page, enable MSTP function for the port.
3	Configure the region name and the revision of MST region	On Spanning Tree → MSTP Instance → Region Config page, configure the region as TP-LINK and keep the default revision setting.
4	Configure VLAN-to-Instance mapping table of the MST region	On Spanning Tree → MSTP Instance → Instance Config page, configure VLAN-to-Instance mapping table. Map VLAN 101, 103 and 105 to Instance 1; map VLAN 102, 104 and 106 to Instance 2.
5	Configure switch C as the root bridge of Instance 1	On Spanning Tree → MSTP Instance → Instance Config page, configure the priority of Instance 1 to be 4096.
6	Configure switch C as the root bridge of Instance 2	On Spanning Tree → MSTP Instance → Instance Config page, configure the priority of Instance 2 to be 0.

- Configure switch D:

Step	Operation	Description
1	Configure ports	On VLAN → 802.1Q VLAN page, configure the link type of the related ports as Trunk, and add the ports to VLAN101-VLAN106. The detailed instructions can be found in the section 802.1Q VLAN .
2	Enable STP function	On Spanning Tree → STP Config → STP Config page, enable STP function and select MSTP version. On Spanning Tree → STP Config → Port Config page, enable MSTP function for the port.
3	Configure the region name and the revision of MST region	On Spanning Tree → MSTP Instance → Region Config page, configure the region as TP-LINK and keep the default revision setting.
4	Configure VLAN-to-Instance mapping table of the MST region	On Spanning Tree → MSTP Instance → Instance Config page, configure VLAN-to-Instance mapping table. Map VLAN 101, 103 and 105 to Instance 1; map VLAN 102, 104 and 106 to Instance 2.

- The configuration procedure for switch E and F is the same with that for switch D.
- **The topology diagram of the two instances after the topology is stable**
- For Instance 1 (VLAN 101, 103 and 105), the red paths in the following figure are connected links; the gray paths are the blocked links.

- For Instance 2 (VLAN 102, 104 and 106), the blue paths in the following figure are connected links; the gray paths are the blocked links.

➤ **Suggestion for Configuration**

- Enable TC Protect function for all the ports of switches.
- Enable Root Protect function for all the ports of root bridges.
- Enable Loop Protect function for the non-edge ports.

Enable BPDU Protect function or BPDU Filter function for the edge ports which are connected to the PC and server.

[Return to CONTENTS](#)

Chapter 8 Multicast

➤ Multicast Overview

In the network, packets are sent in three modes: unicast, broadcast and multicast. In unicast, the source server sends separate copy information to each receiver. When a large number of users require this information, the server must send many pieces of information with the same content to the users. Therefore, large bandwidth will be occupied. In broadcast, the system transmits information to all users in a network. Any user in the network can receive the information, no matter the information is needed or not.

Point-to-multipoint multimedia business, such as video conferences and VoD (video-on-demand), plays an important part in the information transmission field. Suppose a point to multi-point service is required, unicast is suitable for networks with sparsely users, whereas broadcast is suitable for networks with densely distributed users. When the number of users requiring this information is not certain, unicast and broadcast deliver a low efficiency. Multicast solves this problem. It can deliver a high efficiency to send data in the point to multi-point service, which can save large bandwidth and reduce the network load. In multicast, the packets are transmitted in the following way as shown in the following figure.

Figure 8-1 Information transmission in the multicast mode

Features of multicast:

1. The number of receivers is not certain. Usually point-to-multipoint transmission is needed;
2. Multiple users receiving the same information form a multicast group. The multicast information sender just need to send the information to the network device once;
3. Each user can join and leave the multicast group at any time;
4. Real time is highly demanded and certain packets drop is allowed.

➤ **Multicast Address**

1. Multicast IP Address:

As specified by IANA (Internet Assigned Numbers Authority), Class D IP addresses are used as destination addresses of multicast packets. The multicast IP addresses range from 224.0.0.0~239.255.255.255. The following table displays the range and description of several special multicast IP addresses.

Multicast IP address range	Description
224.0.0.0~224.0.0.255	Reserved multicast addresses for routing protocols and other network protocols
224.0.1.0~224.0.1.255	Addresses for video conferencing
239.0.0.0~239.255.255.255	Local management multicast addresses, which are used in the local network only

Table 8-1 Range of the special multicast IP

2. Multicast MAC Address:

When a unicast packet is transmitted in an Ethernet network, the destination MAC address is the MAC address of the receiver. When a multicast packet is transmitted in an Ethernet network, the destination is not a receiver but a group with uncertain number of members, so a multicast MAC address, a logical MAC address, is needed to be used as the destination address.

As stipulated by IANA, the high-order 24 bits of a multicast MAC address begins with 01-00-5E while the low-order 23 bits of a multicast MAC address are the low-order 23 bits of the multicast IP address. The mapping relationship is described as the following figure.

Figure 8-2 Mapping relationship between multicast IP address and multicast MAC address

The high-order 4 bits of the IP multicast address are 1110, identifying the multicast group. Only 23 bits of the remaining low-order 28 bits are mapped to a multicast MAC address. In that way, 5 bits of the IP multicast address is not utilized. As a result, 32 IP multicast addresses are mapped to the same MAC address.

➤ **Multicast Address Table**

The switch is forwarding multicast packets based on the multicast address table. As the transmission of multicast packets can not span the VLAN, the first part of the multicast address table is VLAN ID, based on which the received multicast packets are forwarded in the VLAN owning the receiving port. The multicast address table is not mapped to an egress port but a group port list. When forwarding a multicast packet, the switch looks up the multicast address table based on the destination multicast address of the multicast packet. If the corresponding entry can not be found in the table, the switch will broadcast the packet in the VLAN owning the receiving port. If the corresponding entry can be found in the table, it indicates that the destination address should be a group port list, so the switch will duplicate this multicast data and deliver each port one copy. The general format of the multicast address table is described as Figure 8-3 below.

VLAN ID	Multicast IP	Port
---------	--------------	------

Figure 8-3 Multicast Address Table

➤ **IGMP Snooping**

In the network, the hosts apply to the near Router for joining (leaving) a multicast group by sending IGMP (Internet Group Management Protocol) messages. When the up-stream device forwards down the multicast data, the switch is responsible for sending them to the hosts. IGMP Snooping is a multicast control mechanism, which can be used on the switch for dynamic registration of the multicast group. The switch, running IGMP Snooping, manages and controls the multicast group via listening to and processing the IGMP messages transmitted between the hosts and the multicast router, thereby effectively prevents multicast groups being broadcasted in the network.

The Multicast module is mainly for multicast management configuration of the switch, including four submenus: **IGMP Snooping**, **Multicast IP**, **Multicast Filter**, **Packet Statistics** and **Querier**.

8.1 IGMP Snooping

➤ **IGMP Snooping Process**

The switch, running IGMP Snooping, listens to the IGMP messages transmitted between the host and the router, and tracks the IGMP messages and the registered port. When receiving IGMP report message, the switch adds the port to the multicast address table; when the switch listens to IGMP leave message from the host, the router sends the Group-Specific Query message of the port to check if other hosts need this multicast, if yes, the router will receive IGMP report message; if no, the router will receive no response from the hosts and the switch will remove the port from the multicast address table. The router regularly sends IGMP query messages. After receiving the IGMP query messages, the switch will remove the port from the multicast address table if the switch receives no IGMP report message from the host within a period of time.

➤ **IGMP Messages**

The switch, running IGMP Snooping, processes the IGMP messages of different types as follows.

1. IGMP Query Message

IGMP query message, sent by the router, falls into two types, IGMP general query message and IGMP group-specific-query message. The router regularly sends IGMP general message to query if the multicast groups contain any member. When receiving IGMP leave message, the receiving port of the router will send IGMP group-specific-query message to the multicast group and the switch will forward IGMP group-specific-query message to check if other members in the multicast group of the port need this multicast.

When receiving IGMP general query message, the switch will forward them to all other ports in the VLAN owning the receiving port. The receiving port will be processed: if the receiving port is not a router port yet, it will be added to the router port list with its router port time specified; if the receiving port is already a router port, its router port time will be directly reset.

When receiving IGMP group-specific-query message, the switch will send the group-specific query message to the members of the multicast group being queried.

2. IGMP Report Message

IGMP report message is sent by the host when it applies for joining a multicast group or responses to the IGMP query message from the router.

When receiving IGMP report message, the switch will send the report message via the router port in the VLAN as well as analyze the message to get the address of the multicast group the host applies for joining. The receiving port will be processed: if the receiving port is a new member port, it will be added to the multicast address table with its member port time specified; if the receiving port is already a member port, its member port time will be directly reset.

3. IGMP Leave Message

The host, running IGMPv1, does not send IGMP leave message when leaving a multicast group, as a result, the switch can not get the leave information of the host momentarily. However, after leaving the multicast group, the host does not send IGMP report message any more, so the switch will remove the port from the corresponding multicast address table when its member port time times out. The host, running IGMPv2 or IGMPv3, sends IGMP leave message when leaving a multicast group to inform the multicast router of its leaving.

When receiving IGMP leave message, the switch will forward IGMP group-specific-query message to check if other members in the multicast group of the port need this multicast and reset the member port time to the leave time. When the leave time times out, the switch will remove the port from the corresponding multicast group. If no other member is in the group after the port is removed, the switch will send IGMP leave message to the router and remove the whole multicast group.

➤ IGMP Snooping Fundamentals

1. Ports

Router Port: Indicates the switch port directly connected to the multicast router.

Member Port: Indicates a switch port connected to a multicast group member.

2. Timers

Router Port Time: Within the time, if the switch does not receive IGMP query message from the router port, it will consider this port is not a router port any more. The default value is 300 seconds.

Member Port Time: Within the time, if the switch does not receive IGMP report message from the member port, it will consider this port is not a member port any more. The default value is 260 seconds.

Leave Time: Indicates the interval between the switch receiving a leave message from a host and the switch removing the host from the multicast groups. The default value is 1 second.

The IGMP Snooping function can be implemented on **Snooping Config**, **Port Config**, **VLAN Config** and **Multicast VLAN** pages.

8.1.1 Snooping Config

To configure the IGMP Snooping on the switch, please firstly configure IGMP global configuration and related parameters on this page.

If the multicast address of the received multicast data is not in the multicast address table, the switch will broadcast the data in the VLAN. When Unknown Multicast Discard feature is enabled, the switch drops the received unknown multicast so as to save the bandwidth and enhance the process efficiency of the system. Please configure this feature appropriate to your needs.

Choose the menu **Multicast**→**IGMP Snooping**→**Snooping Config** to load the following page.

Global Config

IGMP Snooping: Enable Disable Apply

Unknown Multicast: Forward Discard

IGMP Snooping Status

Description	Member
Enabled Port	
Enabled VLAN	

Note:

IGMP Snooping will take effect only when Global Config, Port Config and VLAN Config are all enabled.

Figure 8-4 Basic Config

The following entries are displayed on this screen:

➤ **Global Config**

IGMP Snooping: Select Enable/Disable IGMP Snooping function globally on the switch.

Unknown Multicast: Select the operation for the switch to process unknown multicast, Forward or Discard.

➤ **IGMP Snooping Status**

Description: Displays IGMP Snooping status.

Member: Displays the member of the corresponding status.

8.1.2 Port Config

On this page you can configure the IGMP feature for ports of the switch.

Choose the menu **Multicast**→**IGMP Snooping**→**Port Config** to load the following page.

Select	Port	IGMP Snooping	Fast Leave	LAG
<input type="checkbox"/>		Disable	Disable	
<input type="checkbox"/>	1	Disable	Disable	---
<input type="checkbox"/>	2	Disable	Disable	---
<input type="checkbox"/>	3	Disable	Disable	---
<input type="checkbox"/>	4	Disable	Disable	---

<input type="checkbox"/>	11	Disable	Disable	---
<input type="checkbox"/>	12	Disable	Disable	---

Buttons: Apply, Help

Figure 8-5 Port Config

The following entries are displayed on this screen:

➤ **Port Config**

Port Select: Click the **Select** button to quick-select the corresponding port based on the port number you entered.

Select: Select the desired port for IGMP Snooping feature configuration. It is multi-optional.

Port: Displays the port of the switch.

IGMP Snooping: Select Enable/Disable IGMP Snooping for the desired port.

Fast Leave: Select Enable/Disable Fast Leave feature for the desired port. If Fast Leave is enabled for a port, the switch will immediately remove this port from the multicast group upon receiving IGMP leave messages.

LAG: Displays the LAG number which the port belongs to.

Note:

1. Fast Leave on the port is effective only when the host supports IGMPv2 or IGMPv3.
2. When both Fast Leave feature and Unknown Multicast Discard feature are enabled, the leaving of a user connected to a port owning multi-user will result in the other users intermitting the multicast business.

8.1.3 VLAN Config

Multicast groups established by IGMP Snooping are based on VLANs. On this page you can configure different IGMP parameters for different VLANs.

Choose the menu **Multicast**→**IGMP Snooping**→**VLAN Config** to load the following page.

VLAN Config

VLAN ID: (1-4094)

Router Port Time: sec (60-600, recommended: 300)

Member Port Time: sec (60-600, recommended: 260)

Leave Time: sec (1-30, recommended: 1)

Static Router Ports: (Format: 1-3,6,8)

VLAN Table

VLAN ID

Select	VLAN ID	Router Port Time	Member Port Time	Leave Time	Router Ports
<input type="checkbox"/>		<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
<input type="checkbox"/>	2	300	260	1	--

Note:
The settings here will be invalid when multicast VLAN is enabled.

Figure 8-6 VLAN Config

The following entries are displayed on this screen:

➤ **VLAN Config**

VLAN ID: Enter the VLAN ID to enable IGMP Snooping for the desired VLAN.

Router Port Time: Specify the aging time of the router port. Within this time, if the switch doesn't receive IGMP query message from the router port, it will consider this port is not a router port any more.

Member Port Time: Specify the aging time of the member port. Within this time, if the switch doesn't receive IGMP report message from the member port, it will consider this port is not a member port any more.

Leave Time: Specify the interval between the switch receiving a leave message from a host and the switch removing the host from the multicast groups.

Static Router Ports: Enter the static router port which is mainly used in the network with stable topology.

➤ **VLAN Table**

VLAN ID Select: Click the **Select** button to quick-select the corresponding VLAN ID based on the ID number you entered.

Select: Select the desired VLAN ID for configuration. It is multi-optional.

VLAN ID: Displays the VLAN ID.

Router Port Time: Displays the router port time of the VLAN.

Member Port Time: Displays the member port time of the VLAN.

Leave Time: Displays the leave time of the VLAN.

Router Ports:

Displays the router port of the VLAN.

Note:

The settings here will be invalid when multicast VLAN is enabled

Configuration procedure:

Step	Operation	Description
1	Enable IGMP Snooping function	Required. Enable IGMP Snooping globally on the switch and for the port on Multicast→IGMP Snooping→Snooping Config and Port Config page .
2	Configure the multicast parameters for VLANs	Optional. Configure the multicast parameters for VLANs on Multicast→IGMP Snooping→VLAN Config page . If a VLAN has no multicast parameters configuration, it indicates the IGMP Snooping is not enabled in the VLAN, thus the multicast data in the VLAN will be broadcasted.

8.1.4 Multicast VLAN

In old multicast transmission mode, when users in different VLANs apply for join the same multicast group, the multicast router will duplicate this multicast information and deliver each VLAN owning a receiver one copy. This mode wastes a lot of bandwidth.

The problem above can be solved by configuring a multicast VLAN. By adding switch ports to the multicast VLAN and enabling IGMP Snooping, you can make users in different VLANs share the same multicast VLAN. This saves the bandwidth since multicast streams are transmitted only within the multicast VLAN and also guarantees security because the multicast VLAN is isolated from user VLANs.

Before configuring a multicast VLAN, you should firstly configure a VLAN as multicast VLAN and add the corresponding ports to the VLAN on the **802.1Q VLAN** page. If the multicast VLAN is enabled, the multicast configuration for other VLANs on the **VLAN Config** page will be invalid, that is, the multicast streams will be transmitted only within the multicast VLAN.

Choose the menu **Multicast→IGMP Snooping→Multicast VLAN** to load the following page.

Multicast VLAN

Multicast VLAN: Enable Disable

VLAN ID: (2-4094)

Router Port Time: sec (60-600, recommended: 300)

Member Port Time: sec (60-600, recommended: 260)

Leave Time: sec (1-30, recommended: 1)

Router Ports: (Format: 1-3,6,8)

Note:

1. All IGMP packet will be processed in the Multicast VLAN after Multicast VLAN is created.
2. The Multicast VLAN won't take effect unless you first complete the configuration on the VLAN Config page.

Figure 8-7 Multicast VLAN

The following entries are displayed on this screen:

➤ **Multicast VLAN**

- Multicast VLAN:** Select Enable/Disable Multicast VLAN feature.
- VLAN ID:** Enter the VLAN ID of the multicast VLAN.
- Router Port Time:** Specify the aging time of the router port. Within this time, if the switch doesn't receive IGMP query message from the router port, it will consider this port is not a router port any more.
- Member Port Time:** Specify the aging time of the member port. Within this time, if the switch doesn't receive IGMP report message from the member port, it will consider this port is not a member port any more.
- Leave Time:** Specify the interval between the switch receiving a leave message from a host, and the switch removing the host from the multicast groups.
- Router Ports:** Enter the static router port which is mainly used in the network with stable topology.

Note:

1. The router port should be in the multicast VLAN, otherwise the member ports can not receive multicast streams.
2. The Multicast VLAN won't take effect unless you first complete the configuration for the corresponding VLAN owning the port on the **802.1Q VLAN** page.
3. It is recommended to choose GENERAL as the link type of the member ports in the multicast VLAN.
4. Configure the link type of the router port in the multicast VLAN as TRUNK or configure the egress rule as TAG and the link type as GENERAL otherwise all the member ports in the multicast VLAN can not receive multicast streams.
5. After a multicast VLAN is created, all the IGMP packets will be processed only within the multicast VLAN.

Configuration procedure:

Step	Operation	Description
1	Enable IGMP Snooping function	Required. Enable IGMP Snooping globally on the switch and for the port on Multicast→IGMP Snooping→Snooping Config and Port Config page.
2	Create a multicast VLAN	Required. Create a multicast VLAN and add all the member ports and router ports to the VLAN on the VLAN→802.1Q VLAN page. <ul style="list-style-type: none"> • Configure the link type of the member ports as GENERAL. • Configure the link type of the router ports as TRUNK or configure the egress rule as tagged GENERAL.

Step	Operation	Description
3	Configure parameters for multicast VLAN	Optional. Enable and configure a multicast VLAN on the Multicast→IGMP Snooping→Multicast VLAN page. It is recommended to keep the default time parameters.
4	Look over the configuration	If it is successfully configured, the VLAN ID of the multicast VLAN will be displayed in the IGMP Snooping Status table on the Multicast→IGMP Snooping→Snooping Config page.

8.2 Application Example for Multicast VLAN

> Network Requirements

Multicast source sends multicast streams via the router, and the streams are transmitted to user A and user B through the switch.

Router: Its WAN port is connected to the multicast source; its LAN port is connected to the switch. The multicast packets are transmitted in VLAN3.

Switch: Port 3 is connected to the router and the packets are transmitted in VLAN3; port 4 is connected to user A and the packets are transmitted in VLAN4; port 5 is connected to user B and the packets are transmitted in VLAN5.

User A: Connected to Port 4 of the switch.

User B: Connected to port 5 of the switch.

Configure a multicast VLAN, and user A and B receive multicast streams through the multicast VLAN.

> Network Diagram

> Configuration Procedure

Step	Operation	Description
1	Create VLANs	Create three VLANs with the VLAN ID 3, 4 and 5 respectively, and specify the description of VLAN3 as Multicast VLAN on VLAN→802.1Q VLAN page.

Step	Operation	Description
2	Configure ports	On VLAN→802.1Q VLAN function pages. For port 3, configure its link type as GENERAL and its egress rule as TAG, and add it to VLAN3, VLAN4 and VLAN5. For port 4, configure its link type as GENERAL and its egress rule as UNTAG, and add it to VLAN3 and VLAN 4. For port 5, configure its link type as GENERAL and its egress rule as UNTAG, and add it to VLAN3 and VLAN 5.
3	Enable IGMP Snooping function	Enable IGMP Snooping function globally on Multicast→IGMP Snooping→Snooping Config page. Enable IGMP Snooping function for port 3, port4 and port 5 on Multicast→IGMP Snooping→Port Config page.
4	Enable Multicast VLAN	Enable Multicast VLAN, configure the VLAN ID of a multicast VLAN as 3 and keep the other parameters as default on Multicast→IGMP Snooping→Multicast VLAN page.
5	Check Multicast VLAN	3-5 and Multicast VLAN 3 will be displayed in the IGMP Snooping Status table on the Multicast→IGMP Snooping→Snooping Config page.

8.3 Multicast IP

In a network, receivers can join different multicast groups appropriate to their needs. The switch forwards multicast streams based on multicast address table. The Multicast IP can be implemented on **Multicast IP Table** and **Static Multicast IP** page.

8.3.1 Multicast IP Table

On this page you can view the multicast IP table on the switch.

Choose the menu **Multicast→Multicast IP→Multicast IP Table** to load the following page.

Search Option

Multicast IP: (Format: 225.0.0.1)
 VLAN ID: (1-4094) Search
 Port:
 Type: All Static Dynamic

Multicast IP Table

Multicast IP	VLAN ID	Forward Port	Type
<input type="button" value="Refresh"/> <input type="button" value="Help"/>			

Total Multicast IP: 0

Figure 8-8 Multicast IP Table

The following entries are displayed on this screen:

➤ **Search Option**

Multicast IP: Enter the multicast IP address the desired entry must carry.

VLAN ID: Enter the VLAN ID the desired entry must carry.

Port: Select the port number the desired entry must carry.

Type: Select the type the desired entry must carry.

- **All:** Displays all multicast IP entries.
- **Static:** Displays all static multicast IP entries.
- **Dynamic:** Displays all dynamic multicast IP entries.

➤ **Multicast IP Table**

Multicast IP Displays multicast IP address.

VLAN ID: Displays the VLAN ID of the multicast group.

Forward Port Displays the forward port of the multicast group.

Type: Displays the type of the multicast IP.

Note:

If the configuration on VLAN Config page and multicast VLAN page is changed, the switch will clear up the dynamic multicast addresses in multicast address table and learn new addresses.

8.3.2 Static Multicast IP

Static Multicast IP table, isolated from dynamic multicast group and multicast filter, is not learned by IGMP Snooping. It can enhance the quality and security for information transmission in some fixed multicast groups.

Choose the menu **Multicast**→**Multicast IP**→**Static Multicast IP** to load the following page.

The screenshot shows a web interface for configuring and viewing static multicast IP entries. It is divided into three main sections:

- Create Static Multicast:** A form with three input fields: "Multicast IP:" (with a format hint of 225.0.0.1), "VLAN ID:" (with a format hint of 1-4094), and "Forward Port:" (with a format hint of 1-3,6,8). A "Create" button is located to the right of the VLAN ID field.
- Search Option:** A section with a "Search Option:" label, a dropdown menu currently set to "All", an empty search input field, and a "Search" button.
- Static Multicast IP Table:** A table with columns for "Select", "Multicast IP", "VLAN ID", and "Forward Port". Below the table are three buttons: "All", "Delete", and "Help".

At the bottom of the interface, a status line reads "Total Static Multicast IP: 0".

Figure 8-9 Static Multicast IP Table

The following entries are displayed on this screen:

➤ **Create Static Multicast**

- Multicast IP:** Enter static multicast IP address.
- VLAN ID:** Enter the VLAN ID of the multicast IP.
- Forward Port:** Enter the forward port of the multicast group.

➤ **Search Option**

- Search Option:** Select the rules for displaying multicast IP table to find the desired entries quickly.
- **All:** Displays all static multicast IP entries.
 - **Multicast IP:** Enter the multicast IP address the desired entry must carry.
 - **VLAN ID:** Enter the VLAN ID the desired entry must carry.
 - **Port:** Enter the port number the desired entry must carry.

➤ **Static Multicast IP Table**

- Select:** Select the desired entry to delete the corresponding static multicast IP. It is multi-optional.
- Multicast IP:** Displays the multicast IP.
- VLAN ID:** Displays the VLAN ID of the multicast group.
- Forward Port:** Displays the forward port of the multicast group.

8.4 Multicast Filter

When IGMP Snooping is enabled, you can specify the multicast IP-range the ports can join so as to restrict users ordering multicast programs via configuring multicast filter rules.

When applying for a multicast group, the host will send IGMP report message. After receiving the report message, the switch will firstly check the multicast filter rules configured for the receiving port. If the port can be added to the multicast group, it will be added to the multicast address table; if the port can not be added to the multicast group, the switch will drop the IGMP report message. In that way, the multicast streams will not be transmitted to this port, which allows you to control hosts joining the multicast group.

8.4.1 IP-Range

On this page you can figure the desired IP-ranges to be filtered.

Choose the menu **Multicast**→**Multicast Filter**→**IP-Range** to load the following page.

Create IP-Range

IP-Range ID: (1-30)

Start Multicast IP: (Format: 225.0.0.1)

End Multicast IP: (Format: 225.0.0.1)

IP-Range Table

	IP-Range ID	Start Multicast IP	End Multicast IP
<input type="checkbox"/>		<input type="text"/>	<input type="text"/>

Total IP-Range : 0

Figure 8-10 Multicast Filter

The following entries are displayed on this screen:

➤ **Create IP-Range**

IP Range ID: Enter the IP-range ID.

Start Multicast IP: Enter start multicast IP of the IP-range you set.

End Multicast IP: Enter end multicast IP of the IP-range you set.

➤ **IP-Range Table**

IP-Range ID Select: Click the **Select** button to quick-select the corresponding IP-range ID based on the ID number you entered.

Select: Select the desired entry to delete or modify the corresponding IP-range. It is multi-optional.

IP-Range ID: Displays IP-range ID.

Start Multicast IP: Displays start multicast IP of the IP-range.

End Multicast IP: Displays end multicast IP of the IP-range.

8.4.2 Port Filter

On this page you can configure the multicast filter rules for port. Take the configuration on this page and the configuration on IP-Range page together to function to implement multicast filter function on the switch.

Choose the menu **Multicast**→**Multicast Filter**→**Port Filter** to load the following page.

Port Filter Config

Port

Select	Port	Filter	Action Mode	Bound IP-Range (ID)	Max Groups	LAG
<input type="checkbox"/>		Disable	Permit	<input type="text"/>	<input type="text"/>	
<input type="checkbox"/>	1	Disable	permit	---	256	---
<input type="checkbox"/>	2	Disable	permit	---	256	---
<input type="checkbox"/>	3	Disable	permit	---	256	---
<input type="checkbox"/>	4	Disable	permit	---	256	---
<input type="checkbox"/>	5	Disable	permit	---	256	---
<input type="checkbox"/>	6	Disable	permit	---	256	---
<input type="checkbox"/>	7	Disable	permit	---	256	---
<input type="checkbox"/>	8	Disable	permit	---	256	---
<input type="checkbox"/>	9	Disable	permit	---	256	---
<input type="checkbox"/>	10	Disable	permit	---	256	---
<input type="checkbox"/>	11	Disable	permit	---	256	---
<input type="checkbox"/>	12	Disable	permit	---	256	---

Note:

1. The port filter configuration here has no effect on static multicast IP.
2. Up to 15 IP-Ranges can be bound to one port. Please input the Bound IP-Range (ID) in the format like: 1-3,5.
3. "Max Groups" works independently of port filter.

Figure 8-11 Port Filter

The following entries are displayed on this screen:

➤ **Port Filter Config**

- Port Select:** Click the **Select** button to quick-select the corresponding port based on the port number you entered.
- Select:** Select the desired port for multicast filtering. It is multi-optional.
- Port:** Displays the port number.
- Filter:** Select Enable/Disable multicast filtering feature on the port.
- Action Mode:** Select the action mode to process multicast packets when the multicast IP is in the filtering IP-range.
- **Permit:** Only the multicast packets whose multicast IP is in the IP-range will be processed.
 - **Deny:** Only the multicast packets whose multicast IP is not in the IP-range will be processed.
- Bound IP-Range (ID):** Enter the IP-rang ID the port will be bound to. The binding IP-range IDs of the port can be cleared by entering null value in this field and click **Apply** button to submit the configuration.
- Max Groups:** Specify the maximum number of multicast groups to prevent some ports taking up too much bandwidth.
- LAG:** Displays the LAG number which the port belongs to.

Note:

1. Multicast Filter feature can only have effect on the VLAN with IGMP Snooping enabled.
2. Multicast Filter feature has no effect on static multicast IP.
3. Up to 15 IP-Ranges can be bound to one port.

Configuration Procedure:

Step	Operation	Description
1	Configure IP-Range	Required. Configure IP-Range to be filtered on Multicast → Multicast Filter → IP-Range page.
2	Configure multicast filter rules for ports	Optional. Configure multicast filter rules for ports on Multicast → Multicast Filter → Port Filter page.

8.5 Packet Statistics

On this page you can view the multicast data traffic on each port of the switch, which facilitates you to monitor the IGMP messages in the network.

Choose the menu **Multicast**→**Packet Statistics** to load the following page.

Auto Refresh

Auto Refresh: Enable Disable

Refresh Period: sec (3-300)

IGMP Statistics

Port

Port	Query Packet	Report Packet (V1)	Report Packet (V2)	Report Packet (V3)	Leave Packet	Error Packet
1	0	0	0	0	0	0
2	0	0	0	0	0	0
3	0	0	0	0	0	0
4	0	0	0	0	0	0
5	0	0	0	0	0	0
6	0	0	0	0	0	0
7	0	0	0	0	0	0
8	0	0	0	0	0	0
9	0	0	0	0	0	0
10	0	0	0	0	0	0
11	0	0	0	0	0	0
12	0	0	0	0	0	0

Figure 8-12 Packet Statistics

The following entries are displayed on this screen:

➤ **Auto Refresh**

Auto Refresh: Select Enable/Disable auto refresh feature.

Refresh Period: Enter the time from 3 to 300 in seconds to specify the auto refresh period.

➤ **IGMP Statistics**

Port Select: Click the **Select** button to quick-select the corresponding port based on the port number you entered.

- Port:** Displays the port number of the switch.
- Query Packet:** Displays the number of query packets the port received.
- Report Packet (V1):** Displays the number of IGMPv1 report packets the port received.
- Report Packet (V2):** Displays the number of IGMPv2 report packets the port received.
- Report Packet (V3):** Displays the number of IGMPv3 report packets the port received.
- Leave Packet:** Displays the number of leave packets the port received.
- Error Packet:** Displays the number of error packets the port received.

8.6 Querier

In an IP multicast network that runs IGMP, a Layer 3 multicast device works as an IGMP querier to send IGMP queries and manage the multicast table. But IGMP is not supported by the devices in Layer 2 network. IGMP Snooping Querier can act as an IGMP Router in Layer 2 network. It can help to create and maintain multicast forwarding table on the switch with the Query messages it generates.

Choose the menu **Multicast**→**Querier** to load the following page.

IGMP Snooping Querier Config

VLAN ID: (1-4094)

Query Interval: secs(1-300)

Max Response Time: secs(1-25)

General Query Source IP: (format:192.168.0.1)

Last Member Query Interval: secs(1-5) Add

Last Member Query Times: (1-5)

Last Member Query Source IP: (format:192.168.0.1)

IGMP Snooping Querier Table

Select	VLAN ID	Query Interval	Max Response Time	General Query Source IP	Last Member Query Interval	Last Member Query Times	Last Member Query Source IP
<input type="checkbox"/>		<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Submit
Delete
Help

Notice:

- 1.You can only add one IGMP Snooping Querier for each VLAN.
- 2.There may be size effects on choosing query router by adding IGMP Snooping Querier.

Figure 8-13 Packet Statistics

The following entries are displayed on this screen:

➤ **IGMP Snooping Querier Config**

VLAN ID: Enter the ID of the VLAN that enables IGMP Snooping Querier.

Query Interval:	Enter the time interval of sending a general query frame by IGMP Snooping Querier.
Max Response Time:	Enter the maximal time for the host to respond to a general query frame sent by IGMP Snooping Querier.
General Query Source IP:	Enter the source IP of the general query frame sent by IGMP Snooping Querier. It should not be a multicast IP or a broadcast IP.
Last Member Query Interval:	Enter the time interval of sending specific query frames by IGMP Snooping Querier. A specific query will be sent on condition that "fast-leave" is not enabled and a leave frame is received.
Last Member Query Times:	Enter the times of sending specific query frames by IGMP Snooping Querier. At receiving a leave frame, a specific query frame will be sent by IGMP Snooping Querier. If a report frame is received before sending specific frames number reaches "Last Member Query Times", the switch will still treat the port as group member and stop sending specific query frames to the port, otherwise the port will be removed from forward-ports of the IP multicast group.
Last Member Query Source IP:	Enter the source IP of the specific query frame sent by IGMP Snooping Querier. It should not be a multicast IP or a broadcast IP.

➤ **IGMP Snooping Querier Table**

VLAN ID Select:	Click the Select button to quick-select the corresponding port based on the VLAN ID you entered.
Select:	Select the desired entry. It is multi-optional.
VLAN ID:	Displays the ID of the VLAN that enables IGMP Snooping Querier.
Query Interval:	Displays the Query Interval of the IGMP Snooping Querier.
Max Response Time:	Displays the maximal time for the host to respond to a general query frame sent by IGMP Snooping Querier.
General Query Source IP:	Displays the source IP of the general query frame sent by IGMP Snooping Querier.
Last Member Query Interval:	Displays the time interval of sending specific query frames by IGMP Snooping Querier.
Last Member Query Times:	Displays the times of sending specific query frames by IGMP Snooping Querier.
Last Member Query Source IP:	Displays the source IP of the specific query frame sent by IGMP Snooping Querier.

[Return to CONTENTS](#)

Chapter 9 QoS

QoS (Quality of Service) functions to provide different quality of service for various network applications and requirements and optimize the bandwidth resource distribution so as to provide a network service experience of a better quality.

➤ QoS

This switch classifies the ingress packets, maps the packets to different priority queues and then forwards the packets according to specified scheduling algorithms to implement QoS function.

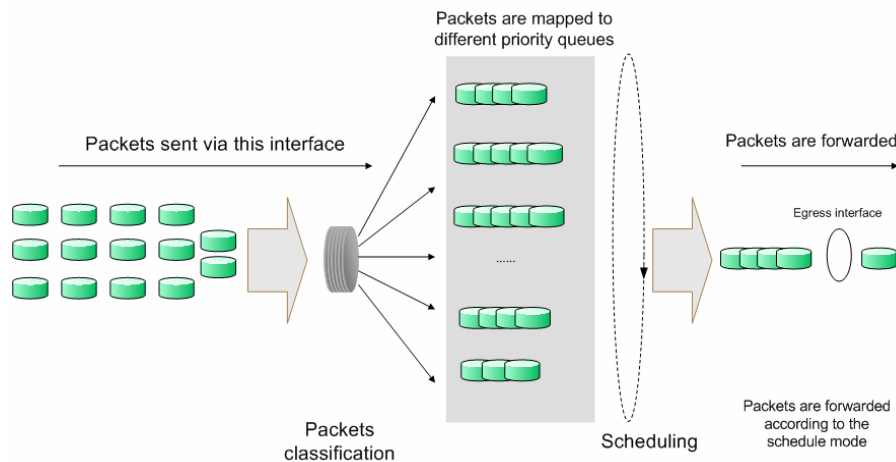

Figure 9-1 QoS function

- Traffic classification: Identifies packets conforming to certain characters according to certain rules.
- Map: The user can map the ingress packets to different priority queues based on the priority modes. This switch implements three priority modes based on port, on 802.1P and on DSCP.
- Queue scheduling algorithm: When the network is congested, the problem that many packets compete for resources must be solved, usually in the way of queue scheduling. The switch supports four schedule modes: SP, WRR, SP+WRR and Equ.

➤ Priority Mode

This switch implements three priority modes based on port, on 802.1P and on DSCP. By default, the priority mode based on port is enabled and the other two modes are optional.

1. Port Priority

Port priority is just a property of the port. After port priority is configured, the data stream will be mapped to the egress queues according to the CoS of the port and the mapping relationship between CoS and queues.

2. 802.1P Priority

Figure 9-2 802.1Q frame

As shown in the figure above, each 802.1Q Tag has a Pri field, comprising 3 bits. The 3-bit priority field is 802.1p priority in the range of 0 to 7. 802.1P priority determines the priority of the packets based on the Pri value. On the Web management page of the switch, you can configure different priority tags mapping to the corresponding priority levels, and then the switch determine which packet is sent preferentially when forwarding packets. The switch processes untagged packets based on the default priority mode.

3. DSCP Priority

Figure 9-3 IP datagram

As shown in the figure above, the ToS (Type of Service) in an IP header contains 8 bits. The first three bits indicate IP precedence in the range of 0 to 7. RFC2474 re-defines the ToS field in the IP packet header, which is called the DS field. The first six bits (bit 0-bit 5) of the DS field indicate DSCP precedence in the range of 0 to 63. The last 2 bits (bit 6 and bit 7) are reserved. On the Web management page, you can configure different DS field mapping to the corresponding priority levels. Non-IP datagram with 802.1Q tag are mapped to different priority levels based on 802.1P priority mode if 802.1P Priority mode is enabled; the untagged non-IP datagram are mapped based on port priority mode.

➤ Schedule Mode

When the network is congested, the problem that many packets compete for resources must be solved, usually in the way of queue scheduling. The switch implements four scheduling queues, TC0, TC1, TC2 and TC3. TC0 has the lowest priority while TC3 has the highest priority. The switch provides four schedule modes: SP, WRR, SP+WRR and Equ.

1. SP-Mode: Strict-Priority Mode. In this mode, the queue with higher priority will occupy the whole bandwidth. Packets in the queue with lower priority are sent only when the queue with higher priority is empty. The switch has four egress queues labeled as TC0, TC1, TC2 and TC3. In SP mode, their priorities increase in order. TC3 has the highest priority. The disadvantage of SP queue is that: if there are packets in the queues with higher priority for a long time in congestion, the packets in the queues with lower priority will be “starved to death” because they are not served.

Figure 9-4 SP-Mode

2. WRR-Mode: Weight Round Robin Mode. In this mode, packets in all the queues are sent in order based on the weight value for each queue and every queue can be assured of a certain service time. The weight value indicates the occupied proportion of the resource. WRR queue overcomes the disadvantage of SP queue that the packets in the queues with lower priority can not get service for a long time. In WRR mode, though the queues are scheduled in order, the service time for each queue is not fixed, that is to say, if a queue is empty, the next queue will be scheduled. In this way, the bandwidth resources are made full use of. The default weight value ratio of TC0, TC1, TC2 and TC3 is 1:2:4:8.

Figure 9-5 WRR-Mode

3. SP+WRR-Mode: Strict-Priority + Weight Round Robin Mode. In this mode, this switch provides two scheduling groups, SP group and WRR group. Queues in SP group and WRR group are scheduled strictly based on strict-priority mode while the queues inside WRR group follow the WRR mode. In SP+WRR mode, TC3 is in the SP group; TC0, TC1 and TC2 belong to the WRR group and the weight value ratio of TC0, TC1 and TC2 is 1:2:4. In this way, when scheduling queues, the switch allows TC3 to occupy the whole bandwidth following the SP mode and the TC0, TC1 and TC2 in the WRR group will take up the bandwidth according to their ratio 1:2:4.
4. Equ-Mode: Equal-Mode. In this mode, all the queues occupy the bandwidth equally. The weight value ratio of all the queues is 1:1:1:1.

The QoS module is mainly for traffic control and priority configuration, including three submenus: **DiffServ**, **Bandwidth Control** and **Voice VLAN**.

9.1 DiffServ

This switch classifies the ingress packets, maps the packets to different priority queues and then forwards the packets according to specified scheduling algorithms to implement QoS function.

This switch implements three priority modes based on port, on 802.1P and on DSCP, and supports four queue scheduling algorithms. The port priorities are labeled as CoS0, CoS1... CoS7.

The DiffServ function can be implemented on **Port Priority**, **DSCP Priority**, **802.1P/CoS Mapping** and **Schedule Mode** pages.

9.1.1 Port Priority

On this page you can configure the port priority.

Choose the menu **QoS**→**DiffServ**→**Port Priority** to load the following page.

Port Priority Config

<input type="checkbox"/>	12	CoS 0	---	▼

note:

Port priority is one property of the port. When the port priority is specified, the data will be classified into the egress queue based on the CoS value of the ingress port and the mapping relation between the CoS and TC in 802.1P/CoS mapping.

Figure 9-6 Port Priority Config

The following entries are displayed on this screen:

➤ **Port Priority Config**

- Select:** Select the desired port to configure its priority. It is multi-optinal.
- Port:** Displays the physical port number of the switch.
- Priority:** Specify the priority for the port.
- LAG:** Displays the LAG number which the port belongs to.

Note:

To complete QoS function configuration, you have to go to the **Schedule Mode** page to select a schedule mode after the configuration is finished on this page.

Configuration Procedure:

Step	Operation	Description
1	Select the port priority	Required. On QoS → DiffServ → Port Priority page, configure the port priority.
2	Configure the mapping relation between the CoS priority and TC	Required. On QoS → DiffServ → 802.1P/CoS mapping page, configure the mapping relation between the CoS and TC.
3	Select a schedule mode	Required. On QoS → DiffServ → Schedule Mode page, select a schedule mode.

9.1.2 DSCP Priority

On this page you can configure DSCP priority. DSCP (DiffServ Code Point) is a new definition to IP ToS field given by IEEE. This field is used to divide IP datagram into 64 priorities. When DSCP Priority is enabled, IP datagram are mapped to different priority levels based on DSCP priority mode; non-IP datagram with 802.1Q tag are mapped to different priority levels based on 802.1P priority mode if 802.1P Priority mode is enabled; the untagged non-IP datagram are mapped based on port priority mode.

Choose the menu **QoS**→**DiffServ**→**DSCP Priority** to load the following page.

DSCP Priority Config

DSCP Priority: Enable Disable Apply

Priority Level

DSCP: Priority Level:

DSCP	Priority Level	DSCP	Priority Level
0	TC0	1	TC0
2	TC0	3	TC0
4	TC0	5	TC0
6	TC0	7	TC0
8	TC0	9	TC0
10	TC0	11	TC0
12	TC0	13	TC0
14	TC0	15	TC0
16	TC1	17	TC1
18	TC1	19	TC1

Apply
Help

note:

Among the priority levels TC0,TC1...TC3, the bigger value,the higher priority.

Figure 9-7 DSCP Priority

The following entries are displayed on this screen:

➤ **DSCP Priority Config**

DSCP Priority: Select Enable or Disable DSCP Priority.

➤ **Priority Level**

DSCP: Indicates the priority determined by the DS region of IP datagram. It ranges from 0 to 63.

Priority Level: Indicates the priority level the packets with tag are mapped to. The priority levels are labeled as TC0, TC1, TC2 and TC3.

 **Note:**
To complete QoS function configuration, you have to go to the **Schedule Mode** page to select a schedule mode after the configuration is finished on this page.

Configuration Procedure:

Step	Operation	Description
1	Configure the mapping relation between the DSCP priority and TC	Required. On QoS→DiffServ→DSCP Priority page, enable DSCP Priority and configure the mapping relation between the DSCP priority and TC.
2	Select a schedule mode	Required. On QoS→DiffServ→Schedule Mode page, select a schedule mode.

9.1.3 802.1P/CoS Mapping

On this page you can configure the mapping relation between the 802.1P priority tag-id/CoS-id and the TC-id.

802.1P gives the Pri field in 802.1Q tag a recommended definition. This field, ranging from 0-7, is used to divide packets into 8 priorities. 802.1P Priority is enabled by default, so the packets with 802.1Q tag are mapped to different priority levels based on 802.1P priority mode but the untagged packets are mapped based on port priority mode. With the same value, the 802.1P priority tag and the CoS will be mapped to the same TC.

Choose the menu **QoS→DiffServ→802.1P/CoS Mapping** to load the following page.

802.1P Priority Config

802.1P Priority: Enable Disable

Priority and CoS-mapping Config

Tag-id/CoS-id: Queue TC-id:

Tag-id/CoS-id	Queue TC-id	Tag-id/CoS-id	Queue TC-id
0	TC1	1	TC0
2	TC0	3	TC1
4	TC2	5	TC2
6	TC3	7	TC3

note:
Among the Queue TC-id TC0,TC1...TC3, the bigger value,the higher priority.

Figure 9-8 802.1P Priority

The following entries are displayed on this screen:

➤ **802.1P Priority Config**

802.1P Priority: Select Enable/Disable 802.1P Priority.

➤ **Priority and CoS-mapping Config**

Tag-id/Cos-id: Indicates the precedence level defined by IEEE802.1P and the CoS ID.

Queue TC-id: Indicates the priority level of egress queue the packets with tag and CoS-id are mapped to. The priority levels of egress queue are labeled as TC0, TC1, TC2 and TC3. By default, the mapping relation between tag/cos and the egress queue is: 0-TC1, 1-TC0, 2-TC0, 3-TC1, 4-TC2, 5-TC2, 6-TC3, 7-TC3.

Note:

To complete QoS function configuration, you have to go to the **Schedule Mode** page to select a schedule mode after the configuration is finished on this page.

Configuration Procedure:

Step	Operation	Description
1	Configure the mapping relation between the 802.1P priority Tag/CoS and the TC	Required. On QoS→DiffServ→802.1P/CoS mapping page, configure the mapping relation between the 802.1P priority Tag/CoS and the TC.
2	Select a schedule mode	Required. On QoS→DiffServ→Schedule Mode page,, select a schedule mode.

9.1.4 Schedule Mode

On this page you can select a schedule mode for the switch. When the network is congested, the problem that many packets compete for resources must be solved, usually in the way of queue scheduling. The switch will control the forwarding sequence of the packets according to the priority queues and scheduling algorithms you set. On this switch, the priority levels are labeled as TC0, TC1...TC3.

Choose the menu **QoS→DiffServ→Schedule Mode** to load the following page.

Figure 9-9 Schedule Mode

The following entries are displayed on this screen:

➤ **Schedule Mode Config**

SP-Mode: Strict-Priority Mode. In this mode, the queue with higher priority will occupy the whole bandwidth. Packets in the queue with lower priority are sent only when the queue with higher priority is empty.

WRR-Mode: Weight Round Robin Mode. In this mode, packets in all the queues are sent in order based on the weight value for each queue. The weight value ratio of TC0, TC1, TC2 and TC3 is 1:2:4:8.

SP+WRR-Mode: Strict-Priority + Weight Round Robin Mode. In this mode, this switch provides two scheduling groups, SP group and WRR group. Queues in SP group and WRR group are scheduled strictly based on strict-priority mode while the queues inside WRR group follow the WRR mode. In SP+WRR mode, TC3 is in the SP group; TC0, TC1 and TC2 belong to the WRR group and the weight value ratio of TC0, TC1 and TC2 is 1:2:4. In this way, when scheduling queues, the switch allows TC3 to occupy the whole bandwidth following the SP mode and the TC0, TC1 and TC2 in the WRR group will take up the bandwidth according to their ratio 1:2:4.

Equ-Mode: Equal-Mode. In this mode, all the queues occupy the bandwidth equally. The weight value ratio of all the queues is 1:1:1:1.

9.2 Bandwidth Control

Bandwidth function, allowing you to control the traffic rate and broadcast flow on each port to ensure network in working order, can be implemented on **Rate Limit** and **Storm Control** pages.

9.2.1 Rate Limit

Rate limit functions to control the ingress/egress traffic rate on each port via configuring the available bandwidth of each port. In this way, the network bandwidth can be reasonably distributed and utilized.

Choose the menu **QoS**→**Bandwidth Control**→**Rate Limit** to load the following page.

Select	Port	Ingress Rate(Kbps)	Egress Rate(Kbps)	LAG
<input type="checkbox"/>				
<input type="checkbox"/>	1	---	---	---
<input type="checkbox"/>	2	---	---	---
<input type="checkbox"/>	3	---	---	---
<input type="checkbox"/>	4	---	---	---
<input type="checkbox"/>	5	---	---	---
<input type="checkbox"/>	6	---	---	---
<input type="checkbox"/>	7	---	---	---
<input type="checkbox"/>	8	---	---	---
<input type="checkbox"/>	9	---	---	---
<input type="checkbox"/>	10	---	---	---
<input type="checkbox"/>	11	---	---	---
<input type="checkbox"/>	12	---	---	---

Note:

1. For one port, you cannot enable the Storm Control and the Ingress rate control at the same time.
2. If you select "Manual" to set Ingress/Egress rate, the system will automatically select integral multiple of 64Kbps that closest to the rate you entered as the real Ingress/Egress rate.

Figure 9-10 Rate Limit

The following entries are displayed on this screen:

➤ **Rate Limit Config**

- Port Select:** Click the **Select** button to quick-select the corresponding port based on the port number you entered.
- Select:** Select the desired port for Rate configuration. It is multi-optional.
- Port:** Displays the port number of the switch.
- Ingress Rate (bps):** Configure the bandwidth for receiving packets on the port. You can select a rate from the dropdown list or select "Manual" to set Ingress rate, the system will automatically select integral multiple of 64Kbps that closest to the rate you entered as the real Ingress rate.
- Egress Rate(bps):** Configure the bandwidth for sending packets on the port. You can select a rate from the dropdown list or select "Manual" to set Egress rate, the system will automatically select integral multiple of 64Kbps that closest to the rate you entered as the real Egress rate.
- LAG:** Displays the LAG number which the port belongs to.

Note:

1. If you enable ingress rate limit feature for the storm control-enabled port, storm control feature will be disabled for this port.
2. When selecting "Manual" to set Ingress/Egress rate, the system will automatically select integral multiple of 64Kbps that closest to the rate you entered as the real Ingress/Egress rate. For example, if you enter 1000Kbps for egress rate, the system will automatically select 1024Kbps as the real Egress rate.
3. When egress rate limit feature is enabled for one or more ports, you are suggested to disable the flow control on each port to ensure the switch works normally.

9.2.2 Storm Control

Storm Control function allows the switch to filter broadcast, multicast and UL frame in the network. If the transmission rate of the three kind packets exceeds the set bandwidth, the packets will be automatically discarded to avoid network broadcast storm.

Choose the menu **QoS**→**Bandwidth Control**→**Storm Control** to load the following page.

Storm Control Config

Port

Select	Port	Broadcast Rate(bps)	Multicast Rate(bps)	UL-Frame Rate(bps)	LAG
<input type="checkbox"/>		<input type="text"/>	<input type="text"/>	<input type="text"/>	
<input type="checkbox"/>	1	---	---	---	---
<input type="checkbox"/>	2	---	---	---	---
<input type="checkbox"/>	3	---	---	---	---
<input type="checkbox"/>	4	---	---	---	---
<input type="checkbox"/>	5	---	---	---	---
<input type="checkbox"/>	6	---	---	---	---
<input type="checkbox"/>	7	---	---	---	---
<input type="checkbox"/>	8	---	---	---	---
<input type="checkbox"/>	9	---	---	---	---
<input type="checkbox"/>	10	---	---	---	---
<input type="checkbox"/>	11	---	---	---	---
<input type="checkbox"/>	12	---	---	---	---

Note:

For one port, you cannot enable the Storm Control and the Ingress rate control at the same time.

Figure 9-11 Storm Control

The following entries are displayed on this screen:

➤ **Storm Control Config**

- Port Select:** Click the **Select** button to quick-select the corresponding port based on the port number you entered.
- Select:** Select the desired port for Storm Control configuration. It is multi-optional.
- Port:** Displays the port number of the switch.
- Broadcast Rate (bps):** Select the bandwidth for receiving broadcast packets on the port. The packet traffic exceeding the bandwidth will be discarded. Select Disable to disable the storm control function for the port.
- Multicast Rate (bps):** Select the bandwidth for receiving multicast packets on the port. The packet traffic exceeding the bandwidth will be discarded. Select Disable to disable the storm control function for the port.
- UL-Frame Rate (bps):** Select the bandwidth for receiving UL-Frame on the port. The packet traffic exceeding the bandwidth will be discarded. Select Disable to disable the storm control function for the port.
- LAG:** Displays the LAG number which the port belongs to.

Note:

If you enable storm control feature for the ingress rate limit-enabled port, ingress rate limit feature will be disabled for this port.

9.3 Voice VLAN

Voice VLANs are configured specially for voice data stream. By configuring Voice VLANs and adding the ports with voice devices attached to voice VLANs, you can perform QoS-related configuration for voice data, ensuring the transmission priority of voice data stream and voice quality.

➤ OUI Address (Organizationally unique identifier address)

The switch can determine whether a received packet is a voice packet by checking its source MAC address. If the source MAC address of a packet complies with the OUI addresses configured by the system, the packet is determined as voice packet and transmitted in voice VLAN.

An OUI address is a unique identifier assigned by IEEE (Institute of Electrical and Electronics Engineers) to a device vendor. It comprises the first 24 bits of a MAC address. You can recognize which vendor a device belongs to according to the OUI address. The following table shows the OUI addresses of several manufacturers. The following OUI addresses are preset of the switch by default.

Number	OUI Address	Vendor
1	00-01-E3-00-00-00	Siemens phone
2	00-03-6B-00-00-00	Cisco phone
3	00-04-0D-00-00-00	Avaya phone
4	00-60-B9-00-00-00	Philips/NEC phone
5	00-D0-1E-00-00-00	Pingtel phone
6	00-E0-75-00-00-00	Polycom phone
7	00-E0-BB-00-00-00	3com phone

Table 9-1 OUI addresses on the switch

➤ Port Voice VLAN Mode

A voice VLAN can operate in two modes: automatic mode and manual mode.

Automatic Mode: In this mode, the switch automatically adds a port which receives voice packets to voice VLAN and determines the priority of the packets through learning the source MAC of the UNTAG packets sent from IP phone when it is powered on. The aging time of voice VLAN can be configured on the switch. If the switch does not receive any voice packet on the ingress port within the aging time, the switch will remove this port from voice VLAN. Voice ports are automatically added into or removed from voice VLAN.

Manual Mode: You need to manually add the port of IP phone to voice VLAN, and then the switch will assign ACL rules and configure the priority of the packets through learning the source MAC address of packets and matching OUI address.

In practice, the port voice VLAN mode is configured according to the type of packets sent out from voice device and the link type of the port. The following table shows the detailed information.

Port Voice VLAN Mode	Voice Stream Type	Link type of the port and processing mode
Automatic Mode	TAG voice stream	ACCESS: Not supported.
		TRUNK: Supported. The default VLAN of the port can not be voice VLAN.
		GENERAL: Supported. The default VLAN of the port can not be voice VLAN and the egress rule of the access port in the voice VLAN should be TAG.
	UNTAG voice stream	ACCESS: Supported.
		TRUNK: Not supported.
		GENERAL: Supported. The default VLAN of the port should be voice VLAN and the egress rule of the access port in the voice VLAN should be UNTAG.
Manual Mode	TAG voice stream	ACCESS: Not supported.
		TRUNK: Supported. The default VLAN of the port should not be voice VLAN.
		GENERAL: Supported. The default VLAN of the port can not be voice VLAN and the egress rule of the access port in the voice VLAN should be TAG.
	UNTAG voice stream	ACCESS: Supported.
		TRUNK: Not supported.
		GENERAL: Supported. The default VLAN of the port should be voice VLAN and the egress rule of the access port in the voice VLAN should be UNTAG.

Table 9-2 Port voice VLAN mode and voice stream processing mode

➤ **Security Mode of Voice VLAN**

When voice VLAN is enabled for a port, you can configure its security mode to filter data stream. If security mode is enabled, the port just forwards voice packets, and discards other packets whose source MAC addresses do not match OUI addresses. If security mode is not enabled, the port forwards all the packets.

Security Mode	Packet Type	Processing Mode
Enable	UNTAG packet	When the source MAC address of the packet is the OUI address that can be identified, the packet can be transmitted in the voice VLAN. Otherwise, the packet will be discarded.
	Packet with voice VLAN TAG	
	Packet with other VLAN TAG	The processing mode for the device to deal with the packet is determined by whether the port permits the VLAN or not, independent of voice VLAN security mode.
Disable	UNTAG packet	Do not check the source MAC address of the packet and all the packets can be transmitted in the voice VLAN.
	Packet with voice VLAN TAG	
	Packet with other VLAN TAG	The processing mode for the device to deal with the packet is determined by whether the port permits the VLAN or not, independent of voice VLAN security mode.

Table 9-3 Security mode and packets processing mode

**Note:**

Don't transmit voice stream together with other business packets in the voice VLAN except for some special requirements.

The Voice VLAN function can be implemented on **Global Config**, **Port Config** and **OUI Config** pages.

9.3.1 Global Config

On this page, you can configure the global parameters of the voice VLAN, including VLAN ID, aging time, the transmission priority of the voice packets and so on.

Choose the menu **QoS**→**Voice VLAN**→**Global Config** to load the following page.

Figure 9-12 Global Configuration

The following entries are displayed on this screen:

➤ **Global Config**

- Voice VLAN:** Select Enable/Disable Voice VLAN function.
- VLAN ID:** Enter the VLAN ID of the voice VLAN.
- Aging Time:** Specifies the living time of the member port in auto mode after the OUI address is aging out.
- Priority:** Select the priority of the port when sending voice data.

9.3.2 Port Config

Before the voice VLAN function is enabled, the parameters of the ports in the voice VLAN should be configured on this page.

Choose the menu **QoS**→**Voice VLAN**→**Port Config** to load the following page.

Port Config

Port

Select	Port	Port Mode	Security Mode	Member State	LAG
<input type="checkbox"/>		<input type="text" value="Auto"/>	<input type="text" value="Disable"/>		
<input type="checkbox"/>	1	Auto	Disable	Inactive	---
<input type="checkbox"/>	2	Auto	Disable	Inactive	---
<input type="checkbox"/>	3	Auto	Disable	Inactive	---
<input type="checkbox"/>	4	Auto	Disable	Inactive	---
<input type="checkbox"/>	5	Auto	Disable	Inactive	---
<input type="checkbox"/>	6	Auto	Disable	Inactive	---
<input type="checkbox"/>	7	Auto	Disable	Inactive	---
<input type="checkbox"/>	8	Auto	Disable	Inactive	---
<input type="checkbox"/>	9	Auto	Disable	Inactive	---
<input type="checkbox"/>	10	Auto	Disable	Inactive	---
<input type="checkbox"/>	11	Auto	Disable	Inactive	---
<input type="checkbox"/>	12	Auto	Disable	Inactive	---
<input type="checkbox"/>	13	Auto	Disable	Inactive	---
<input type="checkbox"/>	14	Auto	Disable	Inactive	---

Note:

For one port, it can't be the member of voice VLAN and private VLAN at the same time.

Figure 9-13 Port Config

Note:

To enable voice VLAN function for the LAG member port, please ensure its member state accords with its port mode.

If a port is a member port of voice VLAN, changing its port mode to be "Auto" will make the port leave the voice VLAN and will not join the voice VLAN automatically until it receives voice streams.

The following entries are displayed on this screen:

➤ **Port Config**

Port Select: Click the **Select** button to quick-select the corresponding port based on the port number you entered.

Select: Select the desired port for voice VLAN configuration. It is multi-optional.

Port: Displays the port number of the switch.

Port Mode: Select the mode for the port to join the voice VLAN.

- **Auto:** In this mode, the switch automatically adds a port to the voice VLAN or removes a port from the voice VLAN by checking whether the port receives voice data or not.
- **Manual:** In this mode, you can manually add a port to the voice VLAN or remove a port from the voice VLAN.

Security Mode: Configure the security mode for forwarding packets.

- **Disable:** All packets are forwarded.
- **Enable:** Only voice data are forwarded.

Member State: Displays the state of the port in the current voice VLAN.

LAG: Displays the LAG number which the port belongs to.

9.3.3 OUI Config

The switch supports OUI creation and adds the MAC address of the special voice device to the OUI table of the switch. The switch determines whether a received packet is a voice packet by checking its OUI address. The switch analyzes the received packets. If the packets are recognized as voice packets, the access port will be automatically added to the Voice VLAN.

Choose the menu **QoS**→**Voice VLAN**→**OUI Config** to load the following page.

Create OUI

OUI: (Format: 00-00-00-00-00-01)

Mask: (Default: FF-FF-FF-00-00-00)

Description: (16 characters maximum)

Select	OUI	Mask	Description
<input type="checkbox"/>	00-01-e3-00-00-00	ff-ff-ff-00-00-00	Siemens Phone
<input type="checkbox"/>	00-03-6b-00-00-00	ff-ff-ff-00-00-00	Cisco Phone
<input type="checkbox"/>	00-04-0d-00-00-00	ff-ff-ff-00-00-00	Avaya Phone
<input type="checkbox"/>	00-60-b9-00-00-00	ff-ff-ff-00-00-00	Philips Phone
<input type="checkbox"/>	00-d0-1e-00-00-00	ff-ff-ff-00-00-00	Pingtel Phone
<input type="checkbox"/>	00-e0-75-00-00-00	ff-ff-ff-00-00-00	PolyCom Phone
<input type="checkbox"/>	00-e0-bb-00-00-00	ff-ff-ff-00-00-00	3Com Phone

Figure 9-14 OUI Configuration

The following entries are displayed on this screen:

➤ **Create OUI**

OUI: Enter the OUI address of the voice device.

Mask: Enter the OUI address mask of the voice device.

Description: Give a description to the OUI for identification.

➤ **OUI Table**

Select: Select the desired entry to view the detailed information.

OUI: Displays the OUI address of the voice device.

Mask: Displays the OUI address mask of the voice device.

Description: Displays the description of the OUI.

Configuration Procedure of Voice VLAN:

Step	Operation	Description
1	Configure the link type of	Required. On VLAN → 802.1Q VLAN → Port Config page,

	the port	configure the link type of ports of the voice device.
Step	Operation	Description
2	Create VLAN	Required. On VLAN → 802.1Q VLAN → Port Config page, click the Create button to create a VLAN.
3	Add OUI address	Optional. On QoS → Voice VLAN → OUI Config page, you can check whether the switch is supporting the OUI template or not. If not, please add the OUI address.
4	Configure the parameters of the ports in voice VLAN.	Required. On QoS → Voice VLAN → Port Config page, configure the parameters of the ports in voice VLAN.
5	Enable Voice VLAN	Required. On QoS → Voice VLAN → Global Config page, configure the global parameters of voice VLAN.

[Return to CONTENTS](#)

Chapter 10 ACL

ACL (Access Control List) is used to filter packets by configuring match rules and process policies of packets in order to control the access of the illegal users to the network. Besides, ACL functions to control traffic flows and save network resources. It provides a flexible and secured access control policy and facilitates you to control the network security.

On this switch, ACLs classify packets based on a series of match conditions, which can be L2-L4 protocol key fields carried in the packets. A time-range based ACL enables you to implement ACL control over packets by differentiating the time-ranges.

The ACL module is mainly for ACL configuration of the switch, including four submenus: **Time-Range**, **ACL Config**, **Policy Config** and **Policy Binding**.

10.1 Time-Range

If a configured ACL is needed to be effective in a specified time-range, a time-range should be firstly specified in the ACL. As the time-range based ACL takes effect only within the specified time-range, data packets can be filtered by differentiating the time-ranges.

On this switch absolute time, week time and holiday can be configured. Configure an absolute time section in the form of “the start date to the end date” to make ACLs effective; configure a week time section to make ACLs effective on the fixed days of the week; configure a holiday section to make ACLs effective on some special days. In each time-range, four time-slices can be configured.

The Time-Range configuration can be implemented on **Time-Range Summary**, **Time-Range Create** and **Holiday Config** pages.

10.1.1 Time-Range Summary

On this page you can view the current time-ranges.

Choose the menu **ACL**→**Time-Range**→**Time-Range Summary** to load the following page.

Select	Index	Time-Range Name	Slice 1	Slice 2	Slice 3	Slice 4	Mode	Operation
--------	-------	-----------------	---------	---------	---------	---------	------	-----------

Figure 10-1 Time-Range Table

The following entries are displayed on this screen:

► Time-Range Table

- Select:** Select the desired entry to delete the corresponding time-range.
- Index:** Displays the index of the time-range.
- Time-Range Name:** Displays the name of the time-range.
- Slice:** Displays the time-slice of the time-range.
- Mode:** Displays the mode the time-range adopts.
- Operation:** Click the **Edit** button to modify the time-range. Click the **Detail** button to display the complete information of this time-range.

10.1.2 Time-Range Create

On this page you can create time-ranges.

Choose the menu **ACL**→**Time-Range**→**Time-Range Create** to load the following page.

Create Time-Range

Name:

Holiday

Absolute Start Date: 2000 / 01 / 01 End Date: 2000 / 01 / 01

Week Mon Tue Wed Thu Fri Sat Sun

Create Time-Slice

Start Time: 00 : 00

End Time: 24 : 00

Time-Slice Table

Index	Start Time	End Time	Delete
-------	------------	----------	--------

Figure 10-2 Time-Range Create

Note:

To successfully configure time-ranges, please firstly specify time-slices and then time-ranges.

The following entries are displayed on this screen:

➤ Create Time-Range

- Name:** Enter the name of the time-range for time identification.
- Holiday:** Select Holiday you set as a time-range. The ACL rule based on this time-range takes effect only when the system time is within the holiday.
- Absolute:** Select Absolute to configure absolute time-range. The ACL rule based on this time-range takes effect only when the system time is within the absolute time-range.
- Week:** Select Week to configure week time-range. The ACL rule based on this time-range takes effect only when the system time is within the week time-range.

➤ Create Time-Slice

- Start Time:** Set the start time of the time-slice.
- End Time:** Set the end time of the time-slice.

➤ Time-Slice Table

- Index:** Displays the index of the time-slice.
- Start Time:** Displays the start time of the time-slice.
- End Time:** Displays the end time of the time-slice.
- Delete:** Click the **Delete** button to delete the corresponding time-slice.

10.1.3 Holiday Config

Holiday mode is applied as a different secured access control policy from the week mode. On this page you can define holidays according to your work arrangement.

Choose the menu **ACL**→**Time-Range**→**Holiday Config** to load the following page.

Holiday Table				
Select	Index	Holiday Name	Start Date	End Date
<input type="checkbox"/>	1	NewYearDay	01/01	01/01
<input type="checkbox"/>	2	LaborDay	05/01	05/03

Figure 10-3 Holiday Configuration

The following entries are displayed on this screen:

➤ **Create Holiday**

Start Date: Specify the start date of the holiday.

End Date: Specify the end date of the holiday.

Holiday Name: Enter the name of the holiday.

➤ **Holiday Table**

Select: Select the desired entry to delete the corresponding holiday.

Index: Displays the index of the holiday.

Holiday Name: Displays the name of the holiday.

Start Date: Displays the start date of the holiday.

End Date: Displays the end date of the holiday.

10.2 ACL Config

An ACL may contain a number of rules, and each rule specifies a different package range. Packets are matched in match order. Once a rule is matched, the switch processes the matched packets taking the operation specified in the rule without considering the other rules, which can enhance the performance of the switch.

Packets are classified based on match rules in order of the rules. Once a rule is matched,

The ACL Config function can be implemented on **ACL Summary**, **ACL Create**, **MAC ACL**, **Standard-IP ACL** and **Extend-IP ACL** pages.

10.2.1 ACL Summary

On this page, you can view the current ACLs configured in the switch.

Choose the menu **ACL**→**ACL Config**→**ACL Summary** to load the following page.

Search Options

Select a ACL:

ACL Type: ---

Rule Order: ---

Rule Table

Figure 10-4 ACL Summary

The following entries are displayed on this screen:

➤ **Search Option**

- Select ACL:** Select the ACL you have created
- ACL Type:** Displays the type of the ACL you select.
- Rule Order:** Displays the rule order of the ACL you select.

➤ **Rule Table**

Display the rule table of the ACL you have selected. Here you can edit the rules, view the details of them, and move them up and down.

10.2.2 ACL Create

On this page you can create ACLs.

Choose the menu **ACL**→**ACL Config**→**ACL Create** to load the following page.

Create ACL

ACL ID:

0-99 MAC ACL

100-199 Standard-IP ACL

200-299 Extend-IP ACL

Rule Order:

Figure 10-5 ACL Create

The following entries are displayed on this screen:

➤ **Create ACL**

- ACL ID:** Enter ACL ID of the ACL you want to create.
- Rule Order:** User Config order is set to be match order in this ACL.

10.2.3 MAC ACL

MAC ACLs analyze and process packets based on a series of match conditions, which can be the source MAC addresses, destination MAC addresses, VLAN ID, and EtherType carried in the packets.

Choose the menu **ACL**→**ACL Config**→**MAC ACL** to load the following page.

Create MAC-Rule

ACL ID: MAC ACL

Rule ID:

Operation: Permit

S-MAC: Mask:

D-MAC: Mask:

VLAN ID:

EtherType: (4-hex number)

User Priority: No Limit

Time-Range: No Limit

Create Help

Figure10-6 Create MAC Rule

The following entries are displayed on this screen:

➤ **Create MAC-Rule**

- ACL ID:** Select the desired MAC ACL for configuration.
- Rule ID:** Enter the rule ID.
- Operation:** Select the operation for the switch to process packets which match the rules.
- **Permit:** Forward packets.
 - **Deny:** Discard Packets.
- S-MAC:** Enter the source MAC address contained in the rule.
- D-MAC:** Enter the destination MAC address contained in the rule.
- MASK:** Enter MAC address mask. If it is set to 1, it must strictly match the address.
- VLAN ID:** Enter the VLAN ID contained in the rule.
- EtherType:** Enter EtherType contained in the rule.
- User Priority:** Select the user priority contained in the rule for the tagged packets to match.
- Time-Range:** Select the time-range for the rule to take effect.

10.2.4 Standard-IP ACL

Standard-IP ACLs analyze and process data packets based on a series of match conditions, which can be the source IP addresses and destination IP addresses carried in the packets.

Choose the menu **ACL**→**ACL Config**→**Standard-IP ACL** to load the following page.

Figure10-7 Create Standard-IP Rule

The following entries are displayed on this screen:

➤ **Create Standard-IP Rule**

- ACL ID:** Select the desired Standard-IP ACL for configuration.
- Rule ID:** Enter the rule ID.
- Operation:** Select the operation for the switch to process packets which match the rules.
- **Permit:** Forward packets.
 - **Deny:** Discard Packets.
- Fragment:** Select if the rule will take effect on the fragment. When the fragment is selected, this rule will process all the fragments and the last piece of fragment will be always forwarded.
- S-IP:** Enter the source IP address contained in the rule.
- D-IP:** Enter the destination IP address contained in the rule.
- Mask:** Enter IP address mask. If it is set to 1, it must strictly match the address.
- Time-Range:** Select the time-range for the rule to take effect.

10.2.5 Extend-IP ACL

Extend-IP ACLs analyze and process data packets based on a series of match conditions, which can be the source IP addresses, destination IP addresses, IP protocol and other information of this sort carried in the packets.

Choose the menu **ACL**→**ACL Config**→**Extend-IP ACL** to load the following page.

Figure10-8 Create Extend-IP Rule

The following entries are displayed on this screen:

➤ **Create Extend-IP Rule**

- ACL ID:** Select the desired Extend-IP ACL for configuration.
- Rule ID:** Enter the rule ID.
- Operation:** Select the operation for the switch to process packets which match the rules.
 - **Permit:** Forward packets.
 - **Deny:** Discard Packets.
- Fragment:** Select if the rule will take effect on the fragment packets. When the fragment is selected, this rule will process all the fragments and the last piece of fragment will be always forwarded.
- S-IP:** Enter the source IP address contained in the rule.
- D-IP:** Enter the destination IP address contained in the rule.
- Mask:** Enter IP address mask. If it is set to 1, it must strictly match the address.
- IP Protocol:** Select IP protocol contained in the rule.
- Select ICMP:** Configure the predefined ICMP type and code.
- ICMP Type:** Configure the predefined ICMP type
- ICMP Code:** Configure the predefined ICMP code.
- TCP Flag:** Configure TCP flag when TCP is selected from the pull-down list of IP Protocol.

- S-Port:** Configure TCP/IP source port contained in the rule when TCP/UDP is selected from the pull-down list of IP Protocol.
- D-Port:** Configure TCP/IP destination port contained in the rule when TCP/UDP is selected from the pull-down list of IP Protocol.
- DSCP:** Enter the DSCP information contained in the rule.
- IP ToS:** Enter the IP-ToS contained in the rule.
- IP Pre:** Enter the IP Precedence contained in the rule.
- Time-Range:** Select the time-range for the rule to take effect.

10.3 Policy Config

A Policy is used to control the data packets those match the corresponding ACL rules by configuring ACLs and actions together for effect. The operations here include stream mirror, stream condition, QoS remarking and redirect.

The Policy Config can be implemented on **Policy Summary**, **Police Create** and **Action Create** pages.

10.3.1 Policy Summary

On this page, you can view the ACL and the corresponding operations in the policy.

Choose the menu **ACL**→**Policy Config**→**Policy Summary** to load the following page.

The screenshot shows a web interface for policy configuration. At the top, there is a 'Select Options' section with a label 'Select a Policy:' followed by a dropdown menu and a 'Delete' button. Below this is an 'Action Table' with the following columns: 'Select', 'Index', 'ACL ID', 'S-Mirror', 'S-Condition', 'Redirect', 'QoS Remark', and 'Operation'. At the bottom of the table, there are three buttons: 'All', 'Delete', and 'Help'.

Figure 10-9 Policy Summary

The following entries are displayed on this screen:

➤ Search Options

Select Policy: Select name of the desired policy for view. If you want to delete the desired policy, please click the **Delete** button.

➤ Action Table

Select: Select the desired entry to delete the corresponding policy.

Index: Enter the index of the policy.

ACL ID: Displays the ID of the ACL contained in the policy.

S-Mirror: Displays the source mirror port of the policy.

S-Condition: Displays the source condition added to the policy.

Redirect: Displays the redirect added to the policy.

QoS Remark: Displays the QoS remark added to the policy.

Operation: Click the **Edit** button to modify the action.

10.3.2 Policy Create

On this page you can create the policy.

Choose the menu **ACL**→**Policy Config**→**Policy Create** to load the following page.

Figure 10-10 Create Policy

The following entries are displayed on this screen:

➤ **Create Policy**

Policy Name: Enter the name of the policy.

10.3.3 Action Create

On this page you can add ACLs and create corresponding actions for the policy.

Choose the menu **ACL**→**Policy Config**→**Action Create** to load the following page.

Figure 10-11 Action Create

The following entries are displayed on this screen:

➤ **Create Action**

Select Policy: Select the name of the policy.

Select ACL: Select the ACL for configuration in the policy.

- S-Mirror:** Select S-Mirror to mirror the data packets in the policy to the specific port.

- S-Condition:** Select S-Condition to limit the transmission rate of the data packets in the policy.
 - **Rate:** Specify the forwarding rate of the data packets those match the corresponding ACL.
 - **Out of Band:** Specify the disposal way of the data packets those are transmitted beyond the rate.

- Redirect:** Select Redirect to change the forwarding direction of the data packets in the policy.
 - **Destination Port:** Forward the data packets those match the corresponding ACL to the specific port.
 - **VLAN ID:** Forward the data packets those match the corresponding ACL in the corresponding VLAN.

- QoS Remark:** Select QoS Remark to forward the data packets based on the QoS settings.
 - **DSCP:** Specify the DSCP region for the data packets those match the corresponding ACL.
 - **Local Priority:** Specify the local priority for the data packets those match the corresponding ACL.

10.4 Policy Binding

Policy Binding function can have the policy take its effect on a specific port/VLAN. The policy will take effect only when it is bound to a port/VLAN. In the same way, the port/VLAN will receive the data packets and process them based on the policy only when the policy is bound to the port/VLAN.

The Policy Binding can be implemented on **Binding Table**, **Port Binding** and **VLAN Binding** pages.

10.4.1 Binding Table

On this page view the policy bound to port/VLAN.

Choose the menu **ACL**→**Policy Binding**→**Binding Table** to load the following page.

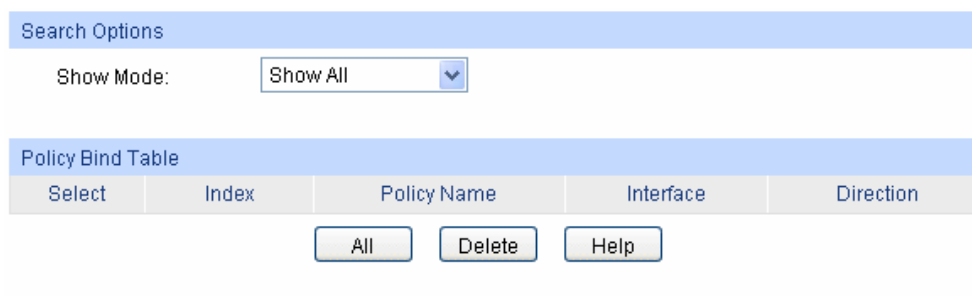

Figure 10-12 Binding Table

The following entries are displayed on this screen:

➤ Search Options

Show Mode: Select a show mode appropriate to your needs.

➤ **Policy Bind Table**

- Select:** Select the desired entry to delete the corresponding binding policy.
- Index:** Displays the index of the binding policy.
- Policy Name:** Displays the name of the binding policy.
- Interface:** Displays the port number or VLAN ID bound to the policy.
- Direction:** Displays the binding direction.

10.4.2 Port Binding

On this page you can bind a policy to a port.

Choose the menu **ACL**→**Policy Binding**→**Port Binding** to load the following page.

The screenshot shows two parts of a web interface. The top part is titled "Port-Bind Config" and contains a form with the following fields and buttons: "Policy Name:" with a dropdown menu showing "Select Policy", "Port:" with a text input field and a "(Format:1-3,6,8)" note, a "Bind" button, and a "Help" button. The bottom part is titled "Port-Bind Table" and shows a table with four columns: "Index", "Policy Name", "Port", and "Direction".

Figure 10-13 Bind the policy to the port

The following entries are displayed on this screen:

➤ **Port-Bind Config**

- Policy Name:** Select the name of the policy you want to bind.
- Port:** Enter the number of the port you want to bind.

➤ **Port-Bind Table**

- Index:** Displays the index of the binding policy.
- Policy Name:** Displays the name of the binding policy.
- Port:** Displays the number of the port bound to the corresponding policy.
- Direction:** Displays the binding direction.

10.4.3 VLAN Binding

On this page you can bind a policy to a VLAN.

Choose the menu **ACL**→**Policy Binding**→**VLAN Binding** to load the following page.

VLAN-Bind Config

Policy Name:

VLAN ID: (Format:2-10,100)

VLAN-Bind Table

Index	Policy Name	VLAN ID	Direction

Figure10-14 Bind the policy to the VLAN

The following entries are displayed on this screen:

➤ **VLAN-Bind Config**

Policy Name: Select the name of the policy you want to bind.

VLAN ID: Enter the ID of the VLAN you want to bind.

➤ **VLAN-Bind Table**

Index: Displays the index of the binding policy.

Policy Name: Displays the name of the binding policy.

VLAN ID: Displays the ID of the VLAN bound to the corresponding policy.

Direction: Displays the binding direction.

Configuration Procedure:

Step	Operation	Description
1	Configure effective time-range	Required. On ACL→Time-Range configuration pages, configure the effective time-ranges for ACLs.
2	Configure ACL rules	Required. On ACL→ACL Config configuration pages, configure ACL rules to match packets.
3	Configure Policy	Required. On ACL→Policy Config configuration pages, configure the policy to control the data packets those match the corresponding ACL rules.
4	Bind the policy to the port/VLAN	Required. On ACL→Policy Binding configuration pages, bind the policy to the port/VLAN to make the policy effective on the corresponding port/VLAN.

10.5 Application Example for ACL

➤ **Network Requirements**

1. The manager of the R&D department can access to the forum of the company without any forbiddance. The MAC address of the manager is 00-64-A5-5D-12-C3.
2. The staff of the R&D department can visit the forum during the working time.
3. The staff of the marketing department can not visit the forum during the working time.
4. The R&D department and marketing department can not communicate with each other.

➤ **Network Diagram**

➤ **Configuration Procedure**

Step	Operation	Description
1	Configure Time-range	On ACL → Time-Range page, create a time-range named work_time. Select Week mode and configure the week time from Monday to Friday. Add a time-slice 08:00~18:00.
2	Configure for requirement 1	<p>On ACL→ACL Config→ACL Create page, create ACL 11.</p> <p>On ACL→ACL Config→MAC ACL page, select ACL 11, create Rule 1, configure the operation as Permit, configure the S-MAC as 00-64-A5-5D-12-C3 and mask as FF-FF-FF-FF-FF-FF, and configure the time-range as No Limit.</p> <p>On ACL→Policy Config→Policy Create page, create a policy named manager.</p> <p>On ACL→Policy Config→Action Create page, add ACL 11 to Policy manager.</p> <p>On ACL→Policy Binding→Port Binding page, select Policy manager to bind to port 3.</p>

Step	Operation	Description
3	Configure requirement and 4 for 2	<p>On ACL→ACL Config→ACL Create page, create ACL 100.</p> <p>On ACL→ACL Config→Standard-IP ACL page, select ACL 100, create Rule 1, configure operation as Deny, configure S-IP as 10.10.70.1 and mask as 255.255.255.0, configure D-IP as 10.10.50.1 and mask as 255.255.255.0, configure the time-range as No Limit.</p> <p>On ACL→ACL Config→Standard-IP ACL page, select ACL 100, create Rule 2, configure operation as Permit, configure S-IP as 10.10.70.1 and mask as 255.255.255.0, configure D-IP as 10.10.88.5 and mask as 255.255.255.255, configure the time-range as work_time.</p> <p>On ACL→ACL Config→Standard-IP ACL page, select ACL 100, create Rule 3, configure operation as Deny, configure S-IP as 10.10.70.1 and mask as 255.255.255.0, configure D-IP as 10.10.88.5 and mask as 255.255.255.0, configure the time-range as No Limit.</p> <p>On ACL→Policy Config→Policy Create page, create a policy named limit1.</p> <p>On ACL→Policy Config→Action Create page, add ACL 100 to Policy limit1.</p> <p>On ACL→Policy Binding→Port Binding page, select Policy limit1 to bind to port 16.</p>
4	Configure requirement and 4 for 3	<p>On ACL→ACL Config→ACL Create page, create ACL 101.</p> <p>On ACL→ACL Config→Standard-IP ACL page, select ACL 101, create Rule 4, configure operation as Deny, configure S-IP as 10.10.50.1 and mask as 255.255.255.0, configure D-IP as 10.10.70.1 and mask as 255.255.255.0, configure the time-range as No Limit.</p> <p>On ACL→ACL Config→Standard-IP ACL page, select ACL 101, create Rule 5, configure operation as Deny, configure S-IP as 10.10.50.1 and mask as 255.255.255.0, configure D-IP as 10.10.88.5 and mask as 255.255.255.255, configure the time-range as work_time.</p> <p>On ACL→Policy Config→Policy Create page, create a policy named limit2.</p> <p>On ACL→Policy Config→Action Create page, add ACL 101 to Policy limit2.</p> <p>On ACL→Policy Binding→Port Binding page, select Policy limit2 to bind to port 4.</p>

[Return to CONTENTS](#)

Chapter 11 Network Security

Network Security module is to provide the multiple protection measures for the network security, including five submenus: **IP-MAC Binding**, **ARP Inspection**, **IP Source Guard**, **DoS Defend** and **802.1X**. Please configure the functions appropriate to your need.

11.1 IP-MAC Binding

The IP-MAC Binding function allows you to bind the IP address, MAC address, VLAN ID and the connected Port number of the Host together. Basing on the IP-MAC binding table, ARP Inspection and IP Source Guard functions can control the network access and only allow the Hosts matching the bound entries to access the network.

The following three IP-MAC Binding methods are supported by the switch.

- (1) **Manually**: You can manually bind the IP address, MAC address, VLAN ID and the Port number together in the condition that you have got the related information of the Hosts in the LAN.
- (2) **Scanning**: You can quickly get the information of the IP address, MAC address, VLAN ID and the connected port number of the Hosts in the LAN via the ARP Scanning function, and bind them conveniently. You are only requested to enter the IP address on the ARP Scanning page for the scanning.
- (3) **DHCP Snooping**: You can use DHCP Snooping functions to monitor the process of the Host obtaining the IP address from DHCP server, and record the IP address, MAC address, VLAN and the connected Port number of the Host for automatic binding.

These three methods are also considered as the sources of the IP-MAC Binding entries. The entries from various sources should be different from one another to avoid collision. Among the entries in collision, only the entry from the source with the highest priority will take effect. These three sources (Manual, Scanning and Snooping) are in descending order of priority.

The **IP-MAC Binding** function is implemented on the **Binding Table**, **Manual Binding**, **ARP Scanning** and **DHCP Snooping** pages.

11.1.1 Binding Table

On this page, you can view the information of the bound entries.

Choose the menu **Network Security**→**IP-MAC Binding**→**Binding Table** to load the following page.

Search Option

Source:

Binding Table

Select	Host Name	IP Address	MAC Address	VLAN ID	Port	Protect Type	Source	Collision
<input type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Entry Count: 0

Note:

1. Among the entries with critical collision level, the one having the highest Source priority will take effect.
2. Among the entries with the same Source priority, only the last added or edited one will take effect.

Figure 11-1 Binding Table

The following entries are displayed on this screen:

➤ **Search Option**

- Source:** Select a Source from the pull-down list and click the **Search** button to view your desired entry in the Binding Table.
- **All:** All the bound entries will be displayed.
 - **Manual:** Only the manually added entries will be displayed.
 - **Scanning:** Only the entries formed via ARP Scanning will be displayed.
 - **Snooping:** Only the entries formed via DHCP Snooping will be displayed.

➤ **Binding Table**

Host Name /IP Address /MAC Address Select: Click the **Select** button to quick-select the corresponding entry based on the Host Name/IP Address/MAC Address you entered.

Select: Select the desired entry to modify the Host Name/MAC Address/VLAN ID/Port /Protect Type. It is multi-optional.

Host Name: Allows you to view and modify the Host Name.

IP Address: Displays the IP Address of the Host.

MAC Address: Allows you to view and modify the MAC Address of the Host.

VLAN ID: Allows you to view and modify the VLAN ID.

Port: Allows you to view and modify the number of port connected to the Host.

Protect Type: Allows you to view and modify the Protect Type of the entry.

Source: Displays the Source of the entry.

Collision: Displays the Collision status of the entry.

- **Warning:** Indicates that the collision may be caused by the MSTP function.
- **Critical:** Indicates that the entry has a collision with the other entries.

Note:

1. Among the entries with Critical collision level, the one with the highest Source priority will take effect.
2. Among the conflicting entries with the same Source priority, only the last added or edited one will take effect.

11.1.2 Manual Binding

You can manually bind the IP address, MAC address, VLAN ID and the Port number together in the condition that you have got the related information of the Hosts in the LAN.

Choose the menu **Network Security**→**IP-MAC Binding**→**Manual Binding** to load the following page.

Manual Binding Option

Host Name: (20 characters maximum)

IP Address: (Format: 192.168.0.1)

MAC Address: (Format: 00-00-00-00-00-01)

VLAN ID: (1-4094)

Port:

Protect Type:

Manual Binding Table

Select	Host Name	IP Address	MAC Address	VLAN ID	Port	Protect Type	Collision

Entry Count: 0

Note:

1. Among the entries with critical collision level, the one having the highest Source priority will take effect.
2. Among the entries with the same Source priority, only the last added or edited one will take effect.

Figure 11-2 Manual Binding

The following entries are displayed on this screen:

➤ **Manual Binding Option**

- Host Name:** Enter the Host Name.
- IP Address:** Enter the IP Address of the Host.
- MAC Address:** Enter the MAC Address of the Host.
- VLAN ID:** Enter the VLAN ID.
- Port:** Select the number of port connected to the Host.
- Protect Type:** Select the Protect Type for the entry.

➤ **Manual Binding Table**

- Select:** Select the desired entry to be deleted. It is multi-optional.
- Host Name:** Displays the Host Name here.
- IP Address:** Displays the IP Address of the Host.
- MAC Address:** Displays the MAC Address of the Host.
- VLAN ID:** Displays the VLAN ID here.
- Port:** Displays the number of port connected to the Host.
- Protect Type:** Displays the Protect Type of the entry.
- Collision:** Displays the Collision status of the entry.
 - **Warning:** Indicates that the collision may be caused by the MSTP function.
 - **Critical:** Indicates that the entry has a collision with the other entries.

11.1.3 ARP Scanning

ARP (Address Resolution Protocol) is used to analyze and map IP addresses to the corresponding MAC addresses so that packets can be delivered to their destinations correctly. IP address is the

address of the Host on Network layer. MAC address, the address of the Host on Data link layer, is necessary for the packet to reach the very device. So the destination IP address carried in a packet need to be translated into the corresponding MAC address.

ARP functions to translate the IP address into the corresponding MAC address and maintain an ARP Table, where the latest used IP address-to-MAC address mapping entries are stored. When the Host communicates with a strange Host, ARP works as the following figure shown.

Figure 11-3 ARP Implementation Procedure

- (1) Suppose there are two hosts in the LAN: Host A and Host B. To send a packet to Host B, Host A checks its own ARP Table first to see if the ARP entry related to the IP address of Host B exists. If yes, Host A will directly send the packets to Host B. If the corresponding MAC address is not found in the ARP Table, Host A will broadcast ARP request packet, which contains the IP address of Host B, the IP address of Host A, and the MAC address of Host A, in the LAN.
- (2) Since the ARP request packet is broadcasted, all hosts in the LAN can receive it. However, only the Host B recognizes and responds to the request. Host B sends back an ARP reply packet to Host A, with its MAC address carried in the packet.
- (3) Upon receiving the ARP reply packet, Host A adds the IP address and the corresponding MAC address of Host B to its ARP Table for the further packets forwarding.

ARP Scanning function enables the switch to send the ARP request packets of the specified IP field to the Hosts in the LAN or VLAN. Upon receiving the ARP reply packet, the switch can get the IP address, MAC address, VLAN and the connected port number of the Host by analyzing the packet and bind them conveniently.

Choose the menu **Network Security**→**IP-MAC Binding**→**ARP Scanning** to load the following page.

Scanning Option

Start IP Address:

End IP Address:

VLAN ID: (1-4094)

Scanning Result

Select	Host Name	IP Address	MAC Address	VLAN ID	Port	Protect Type	Collision
<input type="checkbox"/>	<input type="text"/>					<input type="text"/>	

Entry Count: 0

Note:

1. The VLAN ID option is intended for scanning the network topology with the VLAN spanning across multiple switches.
2. VLAN ID affects the VLAN Tag in the ARP request packets used in the ARP Scanning, and is independent of the VLAN configuration.
3. If VLAN ID is blank, the switch will broadcast untagged ARP request packets in the ARP Scanning.

Figure 11-4 ARP Scanning

The following entries are displayed on this screen:

➤ **Scanning Option**

- Start IP Address:** Specify the Start IP Address.
- End IP Address:** Specify the End IP Address.
- VLAN ID:** Enter the VLAN ID. If blank, the switch will send the untagged packets for scanning.
- Scan:** Click the **Scan** button to scan the Hosts in the LAN.

➤ **Scanning Result**

- Select:** Select the desired entry to be bound or deleted.
- Host Name:** Displays the Host Name here.
- IP Address:** Displays the IP Address of the Host.
- MAC Address:** Displays the MAC Address of the Host.
- VLAN ID:** Displays the VLAN ID here.
- Port:** Displays the number of port connected to the Host.
- Protect Type:** Displays the Protect Type of the entry.
- Collision:** Displays the Collision status of the entry.
- **Warning:** Indicates that the collision may be caused by the MSTP function.
 - **Critical:** Indicates that the entry has a collision with the other entries.

11.1.4 DHCP Snooping

Nowadays, the network is getting larger and more complicated. The amount of the PCs always exceeds that of the assigned IP addresses. The wireless network and the laptops are widely used and the locations of the PCs are always changed. Therefore, the corresponding IP address of the PC should be updated with a few configurations. DHCP (Dynamic Host Configuration Protocol, the network configuration protocol optimized and developed basing on the BOOTP, functions to solve the above mentioned problems.

➤ DHCP Working Principle

DHCP works via the “Client/Server” communication mode. The Client applies to the Server for configuration. The Server assigns the configuration information, such as the IP address, to the Client, so as to reach a dynamic employ of the network source. A Server can assign the IP address for several Clients, which is illustrated in the following figure.

Figure 11-5 Network diagram for DHCP-snooping implementation

For different DHCP Clients, DHCP Server provides three IP address assigning methods:

- (1) Manually assign the IP address: Allows the administrator to bind the static IP address to the specific Client (e.g.: WWW Server) via the DHCP Server.
- (2) Automatically assign the IP address: DHCP Server assigns the IP address without an expiration time limitation to the Clients.
- (3) Dynamically assign the IP address: DHCP Server assigns the IP address with an expiration time. When the time for the IP address expired, the Client should apply for a new one.

The most Clients obtain the IP addresses dynamically, which is illustrated in the following figure.

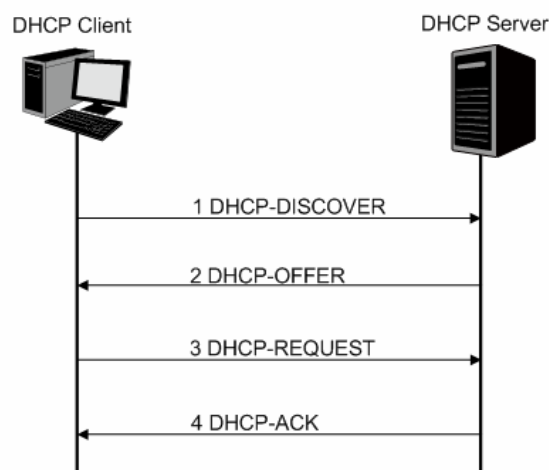

Figure 11-6 Interaction between a DHCP client and a DHCP server

- (1) **DHCP-DISCOVER Stage:** The Client broadcasts the DHCP-DISCOVER packet to find the DHCP Server.

- (2) **DHCP-OFFER Stage:** Upon receiving the DHCP-DISCOVER packet, the DHCP Server selects an IP address from the IP pool according to the assigning priority of the IP addresses and replies to the Client with DHCP-OFFER packet carrying the IP address and other information.
- (3) **DHCP-REQUEST Stage:** In the situation that there are several DHCP Servers sending the DHCP-OFFER packets, the Client will only respond to the first received DHCP-OFFER packet and broadcast the DHCP-REQUEST packet which includes the assigned IP address of the DHCP-OFFER packet.
- (4) **DHCP-ACK Stage:** Since the DHCP-REQUEST packet is broadcasted, all DHCP Servers on the network segment can receive it. However, only the requested Server processes the request. If the DHCP Server acknowledges assigning this IP address to the Client, it will send the DHCP-ACK packet back to the Client. Otherwise, the Server will send the DHCP-NAK packet to refuse assigning this IP address to the Client.

➤ **Option 82**

The DHCP packets are classified into 8 types with the same format basing on the format of BOOTP packet. The difference between DHCP packet and BOOTP packet is the Option field. The Option field of the DHCP packet is used to expand the function, for example, the DHCP can transmit the control information and network parameters via the Option field, so as to assign the IP address to the Client dynamically. For the details of the DHCP Option, please refer to RFC 2132.

Option 82 records the location of the DHCP Client. Upon receiving the DHCP-REQUEST packet, the switch adds the Option 82 to the packet and then transmits the packet to DHCP Server. Administrator can be acquainted with the location of the DHCP Client via Option 82 so as to locate the DHCP Client for fulfilling the security control and account management of Client. The Server supported Option 82 also can set the distribution policy of IP addresses and the other parameters according to the Option 82, providing more flexible address distribution way.

Option 82 can contain 255 sub-options at most. If Option 82 is defined, at least a sub-option should be defined. This switch supports two sub-options: Circuit ID and Remote ID. Since there is no universal standard about the content of Option 82, different manufacturers define the sub-options of Option 82 to their need. For this switch, the sub-options are defined as the following: The Circuit ID is defined to be the number of the port which receives the DHCP Request packets and its VLAN number. The Remote ID is defined to be the MAC address of DHCP Snooping device which receives the DHCP Request packets from DHCP Clients.

➤ **DHCP Cheating Attack**

During the working process of DHCP, generally there is no authentication mechanism between Server and Client. If there are several DHCP servers in the network, network confusion and security problem will happen. The common cases incurring the illegal DHCP servers are the following two:

- (1) It's common that the illegal DHCP server is manually configured by the user by mistake.
- (2) Hacker exhausted the IP addresses of the normal DHCP server and then pretended to be a legal DHCP server to assign the IP addresses and the other parameters to Clients. For example, hacker used the pretended DHCP server to assign a modified DNS server address to users so as to induce the users to the evil financial website or electronic trading website and cheat the users of their accounts and passwords. The following figure illustrates the DHCP Cheating Attack implementation procedure.

Figure 11-7 DHCP Cheating Attack Implementation Procedure

DHCP Snooping feature only allows the port connected to the DHCP Server as the trusted port to forward DHCP packets and thereby ensures that users get proper IP addresses. DHCP Snooping is to monitor the process of the Host obtaining the IP address from DHCP server, and record the IP address, MAC address, VLAN and the connected Port number of the Host for automatic binding. The bound entry can cooperate with the ARP Inspection, IP Source Guard and the other security protection features. DHCP Snooping feature prevents the network from the DHCP Server Cheating Attack by discarding the DHCP packets on the distrusted port, so as to enhance the network security.

Choose the menu **Network Security**→**IP-MAC Binding**→**DHCP Snooping** to load the following page.

Figure 11-8 DHCP Snooping

Note:

If you want to enable the DHCP Snooping feature for the member port of LAG, please ensure the parameters of all the member ports are the same.

The following entries are displayed on this screen:

➤ **DHCP Snooping Config**

DHCP Snooping: Enable/Disable the DHCP Snooping function globally.

Global Flow Control: Select the value to specify the maximum amount of DHCP messages that can be forwarded by the switch per second. The excessive messages will be discarded.

Decline Threshold: Select the value to specify the minimum transmission rate of the Decline packets to trigger the Decline protection for the specific port.

Decline Flow Control:	Select the value to specify the Decline Flow Control. The traffic flow of the corresponding port will be limited to be this value if the transmission rate of the Decline packets exceeds the Decline Threshold.
> Option 82 Config	
Option 82 Support:	Enable/Disable the Option 82 feature.
Existed Option 82 field:	Select the operation for the Option 82 field of the DHCP request packets from the Host. <ul style="list-style-type: none"> • Keep: Indicates to keep the Option 82 field of the packets. • Replace: Indicates to replace the Option 82 field of the packets with the switch defined one. • Drop: Indicates to discard the packets including the Option 82 field.
Customization:	Enable/Disable the switch to define the Option 82.
Circuit ID:	Enter the sub-option Circuit ID for the customized Option 82.
Remote ID:	Enter the sub-option Remote ID for the customized Option 82.
> Port Config	
Port Select:	Click the Select button to quick-select the corresponding port based on the port number you entered.
Select:	Select your desired port for configuration. It is multi-optional.
Port:	Displays the port number.
Trusted Port:	Select Enable/Disable the port to be a Trusted Port. Only the Trusted Port can receive the DHCP packets from DHCP servers.
MAC Verify:	Select Enable/Disable the MAC Verify feature. There are two fields of the DHCP packet containing the MAC address of the Host. The MAC Verify feature is to compare the two fields and discard the packet if the two fields are different.
Flow Control:	Select Enable/Disable the Flow Control feature for the DHCP packets. The excessive DHCP packets will be discarded.
Decline Protect:	Select Enable/Disable the Decline Protect feature.
LAG:	Displays the LAG to which the port belongs to.

11.2 ARP Inspection

According to the ARP Implementation Procedure stated in 11.1.3 [ARP Scanning](#), it can be found that ARP protocol can facilitate the Hosts in the same network segment to communicate with one another or access to external network via Gateway. However, since ARP protocol is implemented with the premise that all the Hosts and Gateways are trusted, there are high security risks during ARP Implementation Procedure in the actual complex network. Thus, the cheating attacks against

ARP, such as imitating Gateway, cheating Gateway, cheating terminal Hosts and ARP Flooding Attack, frequently occur to the network, especially to the large network such as campus network and so on. The following part will simply introduce these ARP attacks.

> **Imitating Gateway**

The attacker sends the MAC address of a forged Gateway to Host, and then the Host will automatically update the ARP table after receiving the ARP response packets, which causes that the Host can not access the network normally. The ARP Attack implemented by imitating Gateway is illustrated in the following figure.

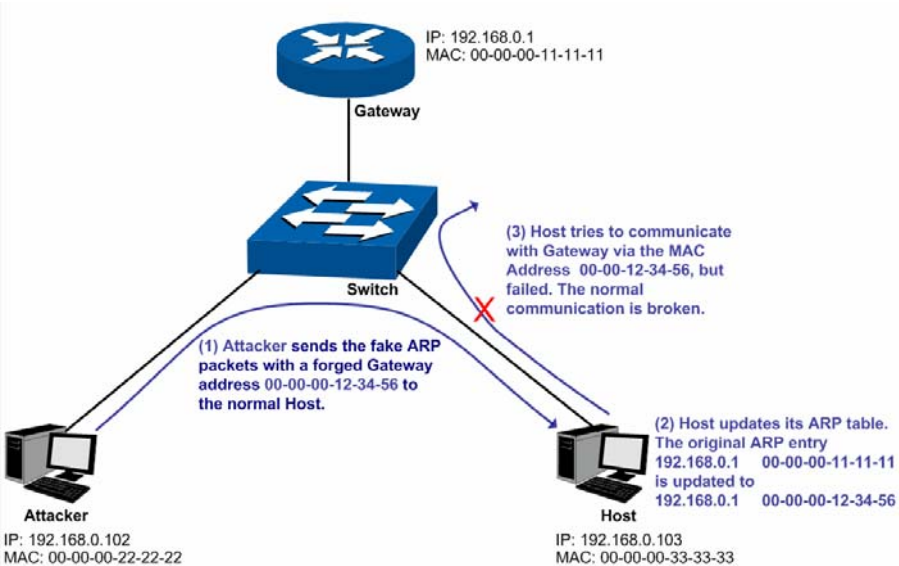

Figure 11-9 ARP Attack - Imitating Gateway

As the above figure shown, the attacker sends the fake ARP packets with a forged Gateway address to the normal Host, and then the Host will automatically update the ARP table after receiving the ARP packets. When the Host tries to communicate with Gateway, the Host will encapsulate this false destination MAC address for packets, which results in a breakdown of the normal communication.

> **Cheating Gateway**

The attacker sends the wrong IP address-to-MAC address mapping entries of Hosts to the Gateway, which causes that the Gateway can not communicate with the legal terminal Hosts normally. The ARP Attack implemented by cheating Gateway is illustrated in the following figure.

Figure 11-10 ARP Attack – Cheating Gateway

As the above figure shown, the attacker sends the fake ARP packets of Host A to the Gateway, and then the Gateway will automatically update its ARP table after receiving the ARP packets. When the Gateway tries to communicate with Host A in LAN, it will encapsulate this false destination MAC address for packets, which results in a breakdown of the normal communication.

➤ **Cheating Terminal Hosts**

The attacker sends the false IP address-to-MAC address mapping entries of terminal Host/Server to another terminal Host, which causes that the two terminal Hosts in the same network segment can not communicate with each other normally. The ARP Attack implemented by cheating terminal Hosts is illustrated in the following figure.

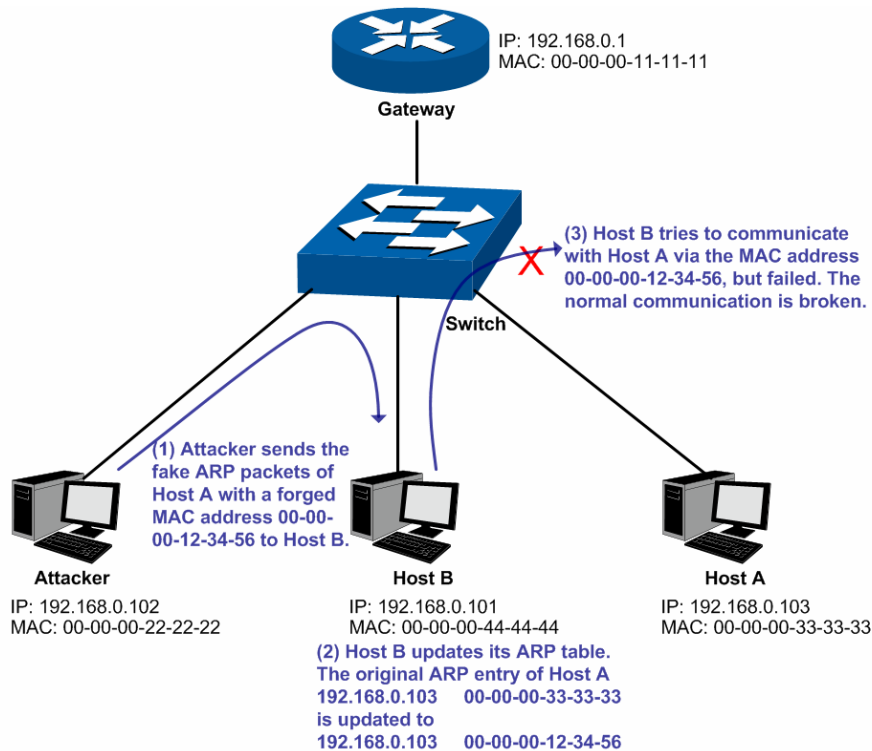

Figure 11-11 ARP Attack – Cheating Terminal Hosts

As the above figure shown, the attacker sends the fake ARP packets of Host A to Host B, and then Host B will automatically update its ARP table after receiving the ARP packets. When Host B tries to communicate with Host A, it will encapsulate this false destination MAC address for packets, which results in a breakdown of the normal communication.

➤ Man-In-The-Middle Attack

The attacker continuously sends the false ARP packets to the Hosts in LAN so as to make the Hosts maintain the wrong ARP table. When the Hosts in LAN communicate with one another, they will send the packets to the attacker according to the wrong ARP table. Thus, the attacker can get and process the packets before forwarding them. During the procedure, the communication packets information between the two Hosts are stolen in the case that the Hosts were unaware of the attack. That is called Man-In-The-Middle Attack. The Man-In-The-Middle Attack is illustrated in the following figure.

Figure 11-12 Man-In-The-Middle Attack

Suppose there are three Hosts in LAN connected with one another through a switch.

Host A: IP address is 192.168.0.101; MAC address is 00-00-00-11-11-11.

Host B: IP address is 192.168.0.102; MAC address is 00-00-00-22-22-22.

Attacker: IP address is 192.168.0.103; MAC address is 00-00-00-33-33-33.

1. First, the attacker sends the false ARP response packets.
2. Upon receiving the ARP response packets, Host A and Host B updates the ARP table of their own.
3. When Host A communicates with Host B, it will send the packets to the false destination MAC address, i.e. to the attacker, according to the updated ARP table.
4. After receiving the communication packets between Host A and Host B, the attacker processes and forwards the packets to the correct destination MAC address, which makes Host A and Host B keep a normal-appearing communication.
5. The attacker continuously sends the false ARP packets to the Host A and Host B so as to make the Hosts always maintain the wrong ARP table.

In the view of Host A and Host B, their packets are directly sent to each other. But in fact, there is a Man-In-The-Middle stolen the packets information during the communication procedure. This kind of ARP attack is called Man-In-The-Middle attack.

➤ ARP Flooding Attack

The attacker broadcasts a mass of various fake ARP packets in a network segment to occupy the network bandwidth viciously, which results in a dramatic slowdown of network speed. Meantime, the Gateway learns the false IP address-to-MAC address mapping entries from these ARP packets and updates its ARP table. As a result, the ARP table is fully occupied by the false entries and unable to learn the ARP entries of legal Hosts, which causes that the legal Hosts can not access the external network.

The IP-MAC Binding function allows the switch to bind the IP address, MAC address, VLAN ID and the connected Port number of the Host together when the Host connects to the switch. Basing on the predefined IP-MAC Binding entries, the ARP Inspection functions to detect the ARP packets and filter the illegal ARP packet so as to prevent the network from ARP attacks.

The **ARP Inspection** function is implemented on the **ARP Detect**, **ARP Defend** and **ARP Statistics** pages.

11.2.1 ARP Detect

ARP Detect feature enables the switch to detect the ARP packets basing on the bound entries in the IP-MAC Binding Table and filter the illegal ARP packets, so as to prevent the network from ARP attacks, such as the Network Gateway Spoofing and Man-In-The-Middle Attack, etc.

Choose the menu **Network Security**→**ARP Inspection**→**ARP Detect** to load the following page.

Apply All Clear Help

Note:

It's recommended to configure the up-linked port and LAG member as trusted port.

Figure 11-13 ARP Detect

The following entries are displayed on this screen:

➤ ARP Detect

ARP Detect: Enable/Disable the ARP Detect function, and click the **Apply** button to apply.

➤ Trusted Port

Trusted Port:

Select the port for which the ARP Detect function is unnecessary as the Trusted Port. The specific ports, such as up-linked port, routing port and LAG port, should be set as Trusted Port. To ensure the normal communication of the switch, please configure the ARP Trusted Port before enabling the ARP Detect function.

Configuration Procedure:

Step	Operation	Description
1	Bind the IP address, MAC address, VLAN ID and the connected Port number of the Host together.	Required. On the IP-MAC Binding page, bind the IP address, MAC address, VLAN ID and the connected Port number of the Host together via Manual Binding, ARP Scanning or DHCP Snooping.
2	Enable the protection for the bound entry.	Required. On the Network Security→IP-MAC Binding→Binding Table page, specify a protect type for the corresponding bound entry.
3	Specify the trusted port.	Required. On the Network Security→ARP Inspection→ARP Detect page, specify the trusted port. The specific ports, such as up-linked port, routing port and LAG port, should be set as Trusted Port.
4	Enable ARP Detect feature.	Required. On the Network Security→ARP Inspection→ARP Detect page, enable the ARP Detect feature.

11.2.2 ARP Defend

With the ARP Defend enabled, the switch can terminate receiving the ARP packets for 300 seconds when the transmission speed of the legal ARP packet on the port exceeds the defined value so as to avoid ARP Attack flood.

Choose the menu **Network Security→ARP Inspection→ARP Defend** to load the following page.

ARP Defend

- **SIP+MAC:** Only the packets with its source IP address, source MAC address and port number matched to the IP-MAC binding rules can be processed.

LAG: Displays the LAG to which the port belongs to.

11.4 DoS Defend

DoS (Denial of Service) Attack is to occupy the network bandwidth maliciously by the network attackers or the evil programs sending a lot of service requests to the Host, which incurs an abnormal service or even breakdown of the network.

With DoS Defend function enabled, the switch can analyze the specific fields of the IP packets and distinguish the malicious DoS attack packets. Upon detecting the packets, the switch will discard the illegal packets directly and limit the transmission rate of the legal packets if the over legal

packets may incur a breakdown of the network. The switch can defend several types of DoS attack listed in the following table.

DoS Attack Type	Description
Land Attack	The attacker sends a specific fake SYN packet to the destination Host. Since both the source IP address and the destination IP address of the SYN packet are set to be the IP address of the Host, the Host will be trapped in an endless circle for building the initial connection. The performance of the network will be reduced extremely.
Scan SYNFIN	The attacker sends the packet with its SYN field and the FIN field set to 1. The SYN field is used to request initial connection whereas the FIN field is used to request disconnection. Therefore, the packet of this type is illegal. The switch can defend this type of illegal packet.
Xmascan	The attacker sends the illegal packet with its TCP index, FIN, URG and PSH field set to 1.
NULL Scan Attack	The attacker sends the illegal packet with its TCP index and all the control fields set to 0. During the TCP connection and data transmission, the packets with all the control fields set to 0 are considered as the illegal packets.
SYN packet with its source port less than 1024	The attacker sends the illegal packet with its TCP SYN field set to 1 and source port less than 1024.
Smurf Attack	By pretending to be a Host, the attacker broadcasts request packets for ICMP response in the LAN. When receiving the request packet, all the Hosts in the LAN will respond and send the reply packets to the actual Host, which will causes this Host to be attacked.
Blat Attack	The attacker sends the illegal packet with its source port and destination port on Layer 4 the same and its URG field set to 1. Similar to the Land Attack, the system performance of the attacked Host is reduced since the Host circularly attempts to build a connection with the attacker.
Ping Flooding	The attacker floods the destination system with Ping broadcast storm packets to forbid the system to respond to the legal communication.
SYN/SYN-ACK Flooding	The attacker uses a fake IP address to send TCP request packets to the Server. Upon receiving the request packets, the Server responds with SYN-ACK packets. Since the IP address is fake, no response will be returned. The Server will keep on sending SYN-ACK packets. If the attacker sends overflowing fake request packets, the network resource will be occupied maliciously and the requests of the legal clients will be denied.
winNuke Attack	Since the Operation System with bugs can not correctly process the URG (Urgent Pointer) of TCP packets, the attacker sends this type of packets to the TCP port139 (NetBIOS) of the Host with the Operation System bugs, which will cause the Host with a blue screen.

Table 11-1 Defendable DoS Attack Types

11.4.1 DoS Defend

On this page, you can enable the DoS Defend type appropriate to your need.

Choose the menu **Network Security**→**DoS Defend**→**DoS Defend** to load the following page.

Defend Config

Figure 11-17 DoS Defend

The following entries are displayed on this screen:

➤ Defend Config

- DoS Defend:** Allows you to Enable/Disable DoS Defend function.
- Ping Limiting:** Specify the transmission rate of the Ping packets when the Defend Type Ping Flooding is enabled.
- SYN Limiting:** Specify the transmission rate of the SYN/SYN-ACK packets when the Defend Type SYN/SYN-ACK Flooding is enabled.

➤ Defend Table

- Select:** Select the entry to enable the corresponding Defend Type.
- Defend Type:** Displays the Defend Type name.
- Attack Count:** Displays the count of the corresponding attack.

11.4.2 DoS Detect

DoS Detect functions to detect the details of the DoS attack packets, based on which you can quickly locate the attacker in the local network.

Choose the menu **Network Security**→**DoS Defend**→**DoS Detect** to load the following page.

The screenshot shows a web interface for DoS detection. At the top, there is a 'Detect Config' section with a 'Detect Time' dropdown menu set to '1 sec' and two buttons: 'Detect' and 'Help'. Below this is a 'Detect Result' section, which is a table with three columns: 'Port', 'Attack Type', and 'Attack Count'. The table is currently empty.

Figure 11-18 DoS Detect

The following entries are displayed on this screen:

➤ **Detect Config**

Detect Time: Specify the detect time for each DoS attack type except the flooding attack type.

Detect: Click the **Detect** button to start the detection. The switch will detect each type of the DoS attack in turn.

➤ **Detect Result**

Port: Display the port number.

Attack Type: Displays the Attack Type name.

Attack Count: Displays the count of the attack.

Tips:

You are suggested to take the following further steps to ensure the network security.

1. It's recommended to inspect and repair the system vulnerability regularly. It is also necessary to install the system bulletins and backup the important information in time.
2. The network administrator is suggested to inspect the physic environment of the network and block the unnecessary network services.
3. Enhance the network security via the protection devices, such as the hardware firewall.

11.5 802.1X

The 802.1X protocol was developed by IEEE802 LAN/WAN committee to deal with the security issues of wireless LANs. It was then used in Ethernet as a common access control mechanism for LAN ports to solve mainly authentication and security problems.

802.1X is a port-based network access control protocol. It authenticates and controls devices requesting for access in terms of the ports of LAN access control devices. With the 802.1X protocol enabled, a supplicant can access the LAN only when it passes the authentication, whereas those failing to pass the authentication are denied when accessing the LAN.

➤ **Architecture of 802.1X Authentication**

802.1X adopts a client/server architecture with three entities: a supplicant system, an authenticator system, and an authentication server system, as shown in the following figure.

Figure 11-19 Architecture of 802.1X authentication

- (1) **Suppliant System:** The suppliant system is an entity in LAN and is authenticated by the authenticator system. The suppliant system is usually a common user terminal computer. An 802.1X authentication is initiated when a user launches client program on the suppliant system. Note that the client program must support the 802.1X authentication protocol.
- (2) **Authenticator System:** The authenticator system is usually an 802.1X-supported network device, such as this TP-LINK switch. It provides the physical or logical port for the suppliant system to access the LAN and authenticates the suppliant system.
- (3) **Authentication Server System:** The authentication server system is an entity that provides authentication service to the authenticator system. Normally in the form of a RADIUS server. Authentication Server can store user information and serve to perform authentication and authorization. To ensure a stable authentication system, an alternate authentication server can be specified. If the main authentication server is in trouble, the alternate authentication server can substitute it to provide normal authentication service.

➤ **The Mechanism of an 802.1X Authentication System**

IEEE 802.1X authentication system uses EAP (Extensible Authentication Protocol) to exchange information between the suppliant system and the authentication server.

- (1) EAP protocol packets transmitted between the suppliant system and the authenticator system are encapsulated as EAPOL packets.
- (2) EAP protocol packets transmitted between the authenticator system and the RADIUS server can either be encapsulated as EAPOR (EAP over RADIUS) packets or be terminated at authenticator system and the authenticator system then communicate with RADIUS servers through PAP (Password Authentication Protocol) or CHAP (Challenge Handshake Authentication Protocol) protocol packets.
- (3) When a suppliant system passes the authentication, the authentication server passes the information about the suppliant system to the authenticator system. The authenticator system in turn determines the state (authorized or unauthorized) of the controlled port according to the instructions (accept or reject) received from the RADIUS server.

➤ **802.1X Authentication Procedure**

An 802.1X authentication can be initiated by suppliant system or authenticator system. When the authenticator system detects an unauthenticated suppliant in LAN, it will initiate the 802.1X authentication by sending EAP-Request/Identity packets to the suppliant. The suppliant system

can also launch an 802.1X client program to initiate an 802.1X authentication through the sending of an EAPOL-Start packet to the switch,

This TP-LINK switch can authenticate supplicant systems in EAP relay mode or EAP terminating mode. The following illustration of these two modes will take the 802.1X authentication procedure initiated by the supplicant system for example.

(1) EAP Relay Mode

This mode is defined in 802.1X. In this mode, EAP-packets are encapsulated in higher level protocol (such as EAPOR) packets to allow them successfully reach the authentication server. This mode normally requires the RADIUS server to support the two fields of EAP: the EAP-message field and the Message-authenticator field. This switch supports EAP-MD5 authentication way for the EAP relay mode. The following figure describes the basic EAP-MD5 authentication procedure.

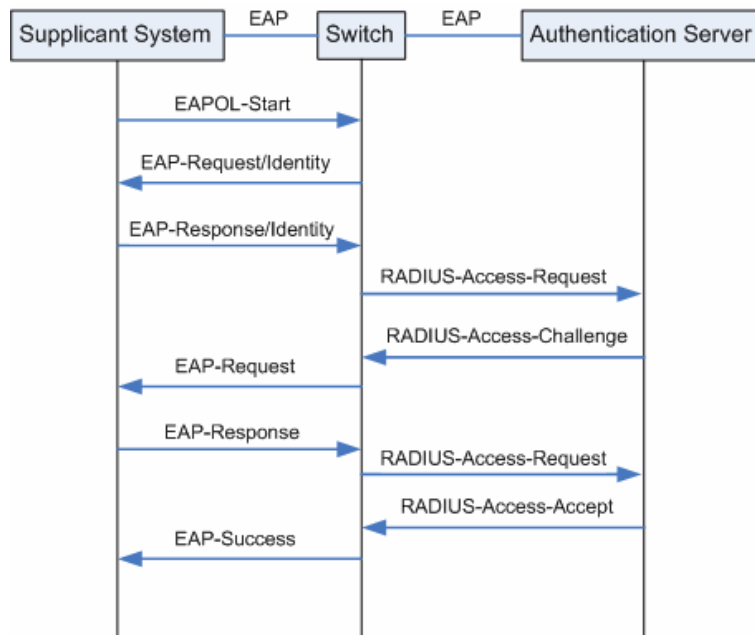

Figure 11-20 EAP-MD5 Authentication Procedure

1. A supplicant system launches an 802.1X client program via its registered user name and password to initiate an access request through the sending of an EAPOL-Start packet to the switch. The 802.1X client program then forwards the packet to the switch to start the authentication process.
2. Upon receiving the authentication request packet, the switch sends an EAP-Request/Identity packet to ask the 802.1X client program for the user name.
3. The 802.1X client program responds by sending an EAP-Response/Identity packet to the switch with the user name included. The switch then encapsulates the packet in a RADIUS Access-Request packet and forwards it to the RADIUS server.
4. Upon receiving the user name from the switch, the RADIUS server retrieves the user name, finds the corresponding password by matching the user name in its database, encrypts the password using a randomly-generated key, and sends the key to the switch through an RADIUS Access-Challenge packet. The switch then sends the key to the 802.1X client program.
5. Upon receiving the key (encapsulated in an EAP-Request/MD5 Challenge packet) from the switch, the client program encrypts the password of the supplicant system with the key and sends the encrypted password (contained in an EAP-Response/MD5 Challenge packet) to the RADIUS server through the switch. (The encryption is irreversible.)

6. The RADIUS server compares the received encrypted password (contained in a RADIUS Access-Request packet) with the locally-encrypted password. If the two match, it will then send feedbacks (through a RADIUS Access-Accept packet and an EAP-Success packet) to the switch to indicate that the supplicant system is authorized.
7. The switch changes the state of the corresponding port to accepted state to allow the supplicant system access the network. And then the switch will monitor the status of supplicant by sending hand-shake packets periodically. By default, the switch will force the supplicant to log off if it can not get the response from the supplicant for two times.
8. The supplicant system can also terminate the authenticated state by sending EAPOL-Logoff packets to the switch. The switch then changes the port state from accepted to rejected.

(2) EAP Terminating Mode

In this mode, packet transmission is terminated at authenticator systems and the EAP packets are mapped into RADIUS packets. Authentication and accounting are accomplished through RADIUS protocol.

In this mode, PAP or CHAP is employed between the switch and the RADIUS server. This switch supports the PAP terminating mode. The authentication procedure of PAP is illustrated in the following figure.

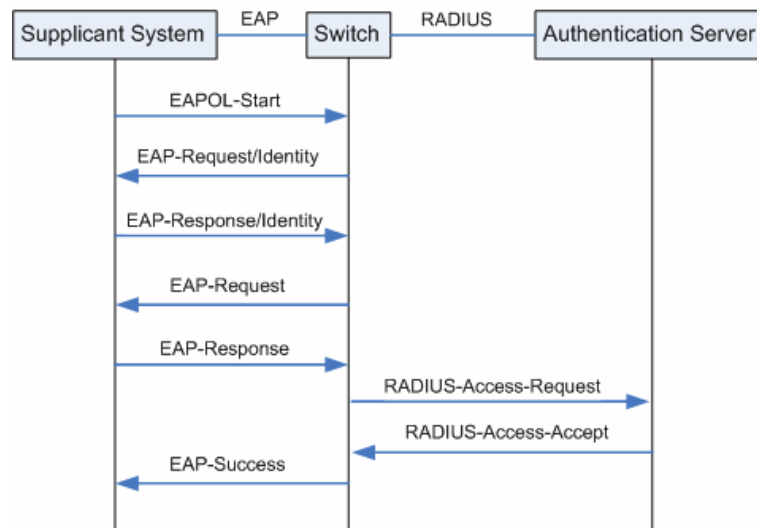

Figure 11-21 PAP Authentication Procedure

In PAP mode, the switch encrypts the password and sends the user name, the randomly-generated key, and the supplicant system-encrypted password to the RADIUS server for further authentication. Whereas the randomly-generated key in EAP-MD5 relay mode is generated by the authentication server, and the switch is responsible to encapsulate the authentication packet and forward it to the RADIUS server.

➤ 802.1X Timer

In 802.1 x authentication, the following timers are used to ensure that the supplicant system, the switch, and the RADIUS server interact in an orderly way:

- (1) **Supplicant system timer (Supplicant Timeout):** This timer is triggered by the switch after the switch sends a request packet to a supplicant system. The switch will resend the request packet to the supplicant system if the supplicant system fails to respond in the specified timeout period.
- (2) **RADIUS server timer (Server Timeout):** This timer is triggered by the switch after the switch sends an authentication request packet to RADIUS server. The switch will resend

the authentication request packet if the RADIUS server fails to respond in the specified timeout period.

- (3) **Quiet-period timer (Quiet Period):** This timer sets the quiet-period. When a supplicant system fails to pass the authentication, the switch quiets for the specified period before it processes another authentication request re-initiated by the supplicant system.

➤ **Guest VLAN**

Guest VLAN function enables the supplicants that do not pass the authentication to access the specific network resource.

By default, all the ports connected to the supplicants belong to a VLAN, i.e. Guest VLAN. Users belonging to the Guest VLAN can access the resources of the Guest VLAN without being authenticated. But they need to be authenticated before accessing external resources. After passing the authentication, the ports will be removed from the Guest VLAN and be allowed to access the other resources.

With the Guest VLAN function enabled, users can access the Guest VLAN to install 802.1X client program or upgrade their 802.1x clients without being authenticated. If there is no supplicant past the authentication on the port in a certain time, the switch will add the port to the Guest VLAN.

With 802.1X function enabled and Guest VLAN configured, after the maximum number retries have been made to send the EAP-Request/Identity packets and there are still ports that have not sent any response back, the switch will then add these ports into the Guest VLAN according to their link types. Only when the corresponding user passes the 802.1X authentication, the port will be removed from the Guest VLAN and added to the specified VLAN. In addition, the port will back to the Guest VLAN when its connected user logs off.

The **802.1X** function is implemented on the **Global Config**, **Port Config** and **Radius Server** pages.

11.5.1 Global Config

On this page, you can enable the 802.1X authentication function globally and control the authentication process by specifying the Authentication Method, Guest VLAN and various Timers.

Choose the menu **Network Security**→**802.1X**→**Global Config** to load the following page.

The image shows two configuration panels. The top panel, titled "Global Config", contains the following settings: "802.1X" is set to "Disable" (radio button selected); "Auth Method" is set to "EAP-MD5" (dropdown menu); "Guest VLAN" is set to "Disable" (radio button selected); and "Guest VLAN ID" is set to "0" (text input field) with a range of "(2-4094)". An "Apply" button is located to the right of these settings. The bottom panel, titled "Authentication Config", contains the following settings: "Quiet" is set to "Disable" (radio button selected); "Quiet Period" is set to "10" (text input field) with a range of "sec (1-999)"; "Retry Times" is set to "3" (text input field) with a range of "(1-9)"; "Supplicant Timeout" is set to "3" (text input field) with a range of "sec (1-9)"; and "Server Timeout" is set to "3" (text input field) with a range of "sec (1-9)". "Apply" and "Help" buttons are located to the right of these settings.

Figure 11-22 Global Config

The following entries are displayed on this screen:

➤ **Global Config**

- 802.1X:** Enable/Disable the 802.1X function.
- Auth Method:** Select the Authentication Method from the pull-down list.
- **EAP-MD5:** IEEE 802.1X authentication system uses extensible authentication protocol (EAP) to exchange information between the switch and the client. The EAP protocol packets with authentication data can be encapsulated in the advanced protocol (such as RADIUS) packets to be transmitted to the authentication server.
 - **PAP:** IEEE 802.1X authentication system uses extensible authentication protocol (EAP) to exchange information between the switch and the client. The transmission of EAP packets is terminated at the switch and the EAP packets are converted to the other protocol (such as RADIUS) packets for transmission.
- Guest VLAN:** Enable/Disable the Guest VLAN feature.
- Guest VLAN ID:** Enter your desired VLAN ID to enable the Guest VLAN feature. The supplicants in the Guest VLAN can access the specified network source.
- **Authentication Config**
- Quiet:** Enable/Disable the Quiet timer.
- Quiet Period:** Specify a value for Quiet Period. Once the supplicant failed to the 802.1X Authentication, then the switch will not respond to the authentication request from the same supplicant during the Quiet Period.
- Retry Times:** Specify the maximum transfer times of the repeated authentication request.
- Supplicant Timeout:** Specify the maximum time for the switch to wait for the response from supplicant before resending a request to the supplicant.
- Server Timeout:** Specify the maximum time for the switch to wait for the response from authentication server before resending a request to the authentication server.

11.5.2 Port Config

On this page, you can configure the 802.1X features for the ports basing on the actual network.

Choose the menu **Network Security**→**802.1X**→**Port Config** to load the following page.

Port Config

Port

Select	Port	Status	Guest VLAN	Control Mode	Control Type	Authorized	LAG
<input type="checkbox"/>	1	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	2	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	3	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	4	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	5	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	6	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	7	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	8	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	9	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	10	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	11	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	12	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	13	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	14	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	15	Disable	Disable	Auto	MAC Based	Yes	---
<input type="checkbox"/>	16	Disable	Disable	Auto	MAC Based	Yes	---

Note:

802.1X can not be enabled for LAG member.

Figure 11-23 Port Config

The following entries are displayed on this screen:

➤ **Port Config**

Port Select: Click the **Select** button to quick-select the corresponding port based on the port number you entered.

Select: Select your desired port for configuration. It is multi-optional.

Port: Displays the port number.

Status: Select Enable/Disable the 802.1X authentication feature for the port.

Guest VLAN: Select Enable/Disable the Guest VLAN feature for the port.

Control Mode: Specify the Control Mode for the port.

- **Auto:** In this mode, the port will normally work only after passing the 802.1X Authentication.
- **Force-Authorized:** In this mode, the port can work normally without passing the 802.1X Authentication.
- **Force-Unauthorized:** In this mode, the port is forbidden working for its fixed unauthorized status.

Control Type: Specify the Control Type for the port.

- **MAC Based:** Any client connected to the port should pass the 802.1X Authentication for access.
- **Port Based:** All the clients connected to the port can access the network on the condition that any one of the clients has passed the 802.1X Authentication.

Authorized: Displays the authentication status of the port.

LAG: Displays the LAG to which the port belongs to.

11.5.3 Radius Server

RADIUS (Remote Authentication Dial-In User Service) server provides the authentication service for the switch via the stored client information, such as the user name, password, etc, with the purpose to control the authentication and accounting status of the clients. On this page, you can configure the parameters of the authentication server.

Choose the menu **Network Security**→**802.1X**→**Radius Server** to load the following page.

The screenshot displays two configuration sections for the Radius Server. The top section, titled 'Authentication Config', includes fields for Primary IP (0.0.0.0), Secondary IP (0.0.0.0), Auth Port (1812), and Auth Key. The bottom section, titled 'Accounting Config', includes a radio button for Accounting (set to Disable), Primary IP (0.0.0.0), Secondary IP (0.0.0.0), Accounting Port (1813), and Accounting Key. Both sections have 'Apply' and 'Help' buttons.

Authentication Config	
Primary IP:	<input type="text" value="0.0.0.0"/> (Format: 192.168.0.1)
Secondary IP:	<input type="text" value="0.0.0.0"/> (Format: 192.168.0.1)
Auth Port:	<input type="text" value="1812"/> (1-65535)
Auth Key:	<input type="text"/>

Accounting Config	
Accounting:	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Primary IP:	<input type="text" value="0.0.0.0"/> (Format: 192.168.0.1)
Secondary IP:	<input type="text" value="0.0.0.0"/> (Format: 192.168.0.1)
Accounting Port:	<input type="text" value="1813"/> (1-65535)
Accounting Key:	<input type="text"/>

Figure 11-24 Radius Server

The following entries are displayed on this screen:

➤ **Authentication Config**

- Primary IP:** Enter the IP address of the authentication server.
- Secondary IP:** Enter the IP address of the alternate authentication server.
- Auth Port:** Set the UDP port of authentication server(s). The default port is 1812
- Auth Key:** Set the shared password for the switch and the authentication servers to exchange messages.

➤ **Accounting Config**

- Accounting:** Enable/Disable the accounting feature.
- Primary IP:** Enter the IP address of the accounting server.
- Secondary IP:** Enter the IP address of the alternate accounting server.
- Accounting Port:** Set the UDP port of accounting server(s). The default port is 1813.
- Accounting Key:** Set the shared password for the switch and the accounting servers to exchange messages.

**Note:**

1. The 802.1X function takes effect only when it is enabled globally on the switch and for the port.
2. The 802.1X function can not be enabled for LAG member ports. That is, the port with 802.1X function enabled can not be added to the LAG.
3. The 802.1X function should not be enabled for the port connected to the authentication server. In addition, the authentication parameters of the switch and the authentication server should be the same.

Configuration Procedure:

Step	Operation	Description
1	Connect an authentication server to the switch and do some configuration.	Required. Record the information of the client in the LAN to the authentication server and configure the corresponding authentication username and password for the client.
2	Install the 802.1X client software.	Required. For the client computers, you are required to install the 802.1X software TpSupplicant provided on the CD. For the installation guide, please refer to Appendix C: 802.1X Client Software .
3	Configure the 802.1X globally.	Required. By default, the global 802.1X function is disabled. On the Network Security→802.1X→Global Config page, configure the 802.1X function globally.
4	Configure the parameters of the authentication server	Required. On the Network Security→802.1X→Radius Server page, configure the parameters of the server.
5	Configure the 802.1X for the port.	Required. On the Network Security→802.1X→Port Config page, configure the 802.1X feature for the port of the switch basing on the actual network.

[Return to CONTENTS](#)

Chapter 12 SNMP

➤ SNMP Overview

SNMP (Simple Network Management Protocol) has gained the most extensive application on the UDP/IP networks. SNMP provides a management frame to monitor and maintain the network devices. It is used for automatically managing the various network devices no matter the physical differences of the devices. Currently, the most network management systems are based on SNMP.

SNMP is simply designed and convenient for use with no need of complex fulfillment procedures and too much network resources. With SNMP function enabled, network administrators can easily monitor the network performance, detect the malfunctions and configure the network devices. In the meantime, they can locate faults promptly and implement the fault diagnosis, capacity planning and report generating.

➤ SNMP Management Frame

SNMP management frame includes three network elements: SNMP Management Station, SNMP Agent and MIB (Management Information Base).

SNMP Management Station: SNMP Management Station is the workstation for running the SNMP client program, providing a friendly management interface for the administrator to manage the most network devices conveniently.

SNMP Agent: Agent is the server software operated on network devices with the responsibility of receiving and processing the request packets from SNMP Management Station. In the meanwhile, Agent will inform the SNMP Management Station of the events whenever the device status changes or the device encounters any abnormalities such as device reboot.

MIB: MIB is the set of the managed objects. MIB defines a few attributes of the managed objects, including the names, the access rights, and the data types. Every SNMP Agent has its own MIB. The SNMP Management station can read/write the MIB objects basing on its management right.

SNMP Management Station is the manager of SNMP network while SNMP Agent is the managed object. The information between SNMP Management Station and SNMP Agent are exchanged through SNMP (Simple Network Management Protocol). The relationship among SNMP Management Station, SNMP Agent and MIB is illustrated in the following figure.

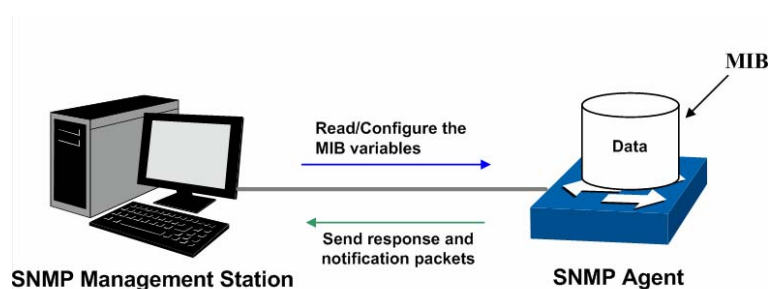

Figure 12-1 Relationship among SNMP Network Elements

➤ SNMP Versions

This switch supports SNMP v3, and is compatible with SNMP v1 and SNMP v2c. The SNMP versions adopted by SNMP Management Station and SNMP Agent should be the same. Otherwise, SNMP Management Station and SNMP Agent can not communicate with each other normally. You can select the management mode with proper security level according to your actual application requirement.

SNMP v1: SNMP v1 adopts Community Name authentication. The community name is used to define the relation between SNMP Management Station and SNMP Agent. The SNMP packets

failing to pass community name authentication are discarded. The community name can limit access to SNMP Agent from SNMP NMS, functioning as a password.

SNMP v2c: SNMP v2c also adopts community name authentication. It is compatible with SNMP v1 while enlarges the function of SNMP v1.

SNMP v3: Basing on SNMP v1 and SNMP v2c, SNMP v3 extremely enhances the security and manageability. It adopts VACM (View-based Access Control Model) and USM (User-Based Security Model) authentication. The user can configure the authentication and the encryption functions. The authentication function is to limit the access of the illegal user by authenticating the senders of packets. Meanwhile, the encryption function is used to encrypt the packets transmitted between SNMP Management Station and SNMP Agent so as to prevent any information being stolen. The multiple combinations of authentication function and encryption function can guarantee a more reliable communication between SNMP Management station and SNMP Agent.

➤ MIB Introduction

To uniquely identify the management objects of the device in SNMP messages, SNMP adopts the hierarchical architecture to identify the managed objects. It is like a tree, and each tree node represents a managed object, as shown in the following figure. Thus the object can be identified with the unique path starting from the root and indicated by a string of numbers. The number string is the Object Identifier of the managed object. In the following figure, the OID of the managed object B is {1.2.1.1}. While the OID of the managed object A is {1.2.1.1.5}.

Figure 12-2 Architecture of the MIB tree

➤ SNMP Configuration Outline

1. Create View

The SNMP View is created for the SNMP Management Station to manage MIB objects. The managed object, uniquely identified by OID, can be set to under or out of the management of SNMP Management Station by configuring its view type (included/excluded). The OID of managed object can be found on the SNMP client program running on the SNMP Management Station.

2. Create SNMP Group

After creating the SNMP View, it's required to create an SNMP Group. The Group Name, Security Model and Security Level compose the identifier of the SNMP Group. The Groups with these three items the same are considered to be the same. You can configure SNMP Group to control the network access by providing the users in various groups with different management rights via the Read View, Write View and Notify View.

3. Create SNMP User

The User configured in an SNMP Group can manage the switch via the client program on management station. The specified User Name and the Auth/Privacy Password are used for SNMP Management Station to access the SNMP Agent, functioning as the password.

SNMP module is used to configure the SNMP function of the switch, including three submenus: **SNMP Config**, **Notification** and **RMON**.

12.1 SNMP Config

The **SNMP Config** can be implemented on the **Global Config**, **SNMP View**, **SNMP Group**, **SNMP User** and **SNMP Community** pages.

12.1.1 Global Config

To enable SNMP function, please configure the SNMP function globally on this page.

Choose the menu **SNMP**→**SNMP Config**→**Global Config** to load the following page.

Global Config

SNMP: Enable Disable

Local Engine

Local Engine ID: (10-64 Hex)

Remote Engine

Remote Engine ID: (0 or 10-64 Hex)

Note:

The total hexadecimal characters of Engine ID should be even.

Figure 12-3 Global Config

The following entries are displayed on this screen:

➤ **Global Config**

SNMP: Enable/Disable the SNMP function.

➤ **Local Engine**

Local Engine ID: Specify the switch's Engine ID for the remote clients. The Engine ID is a unique alphanumeric string used to identify the SNMP engine on the switch.

➤ **Remote Engine**

Remote Engine ID: Specify the Remote Engine ID for switch. The Engine ID is a unique alphanumeric string used to identify the SNMP engine on the remote device which receives informs from switch.

Note:

The amount of Engine ID characters must be even.

12.1.2 SNMP View

The OID (Object Identifier) of the SNMP packets is used to describe the managed objects of the switch, and the MIB (Management Information Base) is the set of the OIDs. The SNMP View is created for the SNMP management station to manage MIB objects.

Choose the menu **SNMP**→**SNMP Config**→**SNMP View** to load the following page.

Select	View Name	View Type	MIB Object ID
<input type="checkbox"/>	viewDefault	Include	1
<input type="checkbox"/>	viewDefault	Exclude	1.3.6.1.6.3.15
<input type="checkbox"/>	viewDefault	Exclude	1.3.6.1.6.3.16
<input type="checkbox"/>	viewDefault	Exclude	1.3.6.1.6.3.18

Figure 12-4 SNMP View

The following entries are displayed on this screen:

➤ View Config

View Name: Give a name to the View for identification. Each View can include several entries with the same name.

MIB Object ID: Enter the Object Identifier (OID) for the entry of View.

View Type: Select the type for the view entry.

- **Include:** The view entry can be managed by the SNMP management station.
- **Exclude:** The view entry can not be managed by the SNMP management station.

➤ View Table

Select: Select the desired entry to delete the corresponding view. All the entries of a View will be deleted together.

View Name: Displays the name of the View entry.

View Type: Displays the type of the View entry.

MIB Object ID: Displays the OID of the View entry.

12.1.3 SNMP Group

On this page, you can configure SNMP Group to control the network access by providing the users in various groups with different management rights via the Read View, Write View and Notify View.

Choose the menu **SNMP**→**SNMP Config**→**SNMP Group** to load the following page.

Group Config

Group Name: (16 characters maximum)

Security Model:

Security Level:

Read View:

Write View:

Notify View:

Group Table

Select	Group Name	Security Model	Security Level	Read View	Write View	Notify View	Operation
<input type="button" value="All"/> <input type="button" value="Delete"/> <input type="button" value="Help"/>							

Note:
A group should contain a read view, and the default read view is viewDefault.

Figure 12-5 SNMP Group

The following entries are displayed on this screen:

➤ **Group Config**

Group Name: Enter the SNMP Group name. The Group Name, Security Model and Security Level compose the identifier of the SNMP Group. These three items of the Users in one group should be the same.

Security Model: Select the Security Model for the SNMP Group.

- **v1:** SNMPv1 is defined for the group. In this model, the Community Name is used for authentication. SNMP v1 can be configured on the SNMP Community page directly.
- **v2c:** SNMPv2c is defined for the group. In this model, the Community Name is used for authentication. SNMP v2c can be configured on the SNMP Community page directly.
- **v3:** SNMPv3 is defined for the group. In this model, the USM mechanism is used for authentication. If SNMPv3 is enabled, the Security Level field is enabled for configuration.

Security Level: Select the Security Level for the SNMP v3 Group.

- **noAuthNoPriv:** No authentication and no privacy security level is used.
- **authNoPriv:** Only the authentication security level is used.
- **authPriv:** Both the authentication and the privacy security levels are used.

Read View: Select the View to be the Read View. The management access is restricted to read-only, and changes cannot be made to the assigned SNMP View.

Write View: Select the View to be the Write View. The management access is writing only and changes can be made to the assigned SNMP View. The View defined both as the Read View and the Write View can be read and modified.

Notify View: Select the View to be the Notify View. The management station can receive notification messages of the assigned SNMP view generated by the switch's SNMP agent.

➤ **Group Table**

- Select:** Select the desired entry to delete the corresponding group. It's multi-optional.
- Group Name:** Displays the Group Name here.
- Security Model:** Displays the Security Model of the group.
- Security Level:** Displays the Security Level of the group.
- Read View:** Displays the Read View name in the entry.
- Write View:** Displays the Write View name in the entry.
- Notify View:** Displays the Notify View name in the entry.
- Operation:** Click the **Edit** button to modify the Views in the entry and click the **Modify** button to apply.

Note:

Every Group should contain a Read View. The default Read View is viewDefault.

12.1.4 SNMP User

The User in an SNMP Group can manage the switch via the management station software. The User and its Group have the same security level and access right. You can configure the SNMP User on this page.

Choose the menu **SNMP**→**SNMP Config**→**SNMP User** to load the following page.

User Config

User Name: (16 characters maximum)

User Type: Group Name:

Security Model: Security Level:

Auth Mode: Auth Password: (16 characters maximum)

Privacy Mode: Privacy Password: (16 characters maximum)

User Table

Select	User Name	User Type	Group Name	Security Model	Security Level	Auth Mode	Privacy Mode	Operation
--------	-----------	-----------	------------	----------------	----------------	-----------	--------------	-----------

Note:

The security model and security level of the user should be the same with that of its group.

Figure 12-6 SNMP User

The following entries are displayed on this screen:

➤ **User Config**

- User Name:** Enter the User Name here.

User Type:	Select the type for the User. <ul style="list-style-type: none"> • Local User: Indicates that the user is connected to a local SNMP engine. • Remote User: Indicates that the user is connected to a remote SNMP engine.
Group Name:	Select the Group Name of the User. The User is classified to the corresponding Group according to its Group Name, Security Model and Security Level.
Security Model:	Select the Security Model for the User.
Security Level:	Select the Security Level for the SNMP v3 User.
Auth Mode:	Select the Authentication Mode for the SNMP v3 User. <ul style="list-style-type: none"> • None: No authentication method is used. • MD5: The port authentication is performed via HMAC-MD5 algorithm. • SHA: The port authentication is performed via SHA (Secure Hash Algorithm). This authentication mode has a higher security than MD5 mode.
Auth Password:	Enter the password for authentication.
Privacy Mode:	Select the Privacy Mode for the SNMP v3 User. <ul style="list-style-type: none"> • None: No privacy method is used. • DES: DES encryption method is used.
Privacy Password:	Enter the Privacy Password.
➤ User Table	
Select:	Select the desired entry to delete the corresponding User. It is multi-optional.
User Name:	Displays the name of the User.
User Type:	Displays the User Type.
Group Name:	Displays the Group Name of the User.
Security Model:	Displays the Security Model of the User.
Security Level:	Displays the Security Level of the User.
Auth Mode:	Displays the Authentication Mode of the User.
Privacy Mode:	Displays the Privacy Mode of the User.
Operation:	Click the Edit button to modify the Group of the User and click the Modify button to apply.

Note:

The SNMP User and its Group should have the same Security Model and Security Level.

12.1.5 SNMP Community

SNMP v1 and SNMP v2c adopt community name authentication. The community name can limit access to the SNMP agent from SNMP network management station, functioning as a password. If SNMP v1 or SNMP v2c is employed, you can directly configure the SNMP Community on this page without configuring SNMP Group and User.

Choose the menu **SNMP**→**SNMP Config**→**SNMP Community** to load the following page.

Community Config

Community Name: (16 characters maximum)

Access:

MIB View:

Create Clear

Community Table

Select	Community Name	Access	MIB View	Operation
--------	----------------	--------	----------	-----------

All Delete Help

Note:

The default MIB view of community is viewDefault.

Figure 12-7 SNMP Community

The following entries are displayed on this screen:

➤ **Community Config**

Community Name: Enter the Community Name here.

Access: Defines the access rights of the community.

- **read-only:** Management right of the Community is restricted to read-only, and changes cannot be made to the corresponding View.
- **read-write:** Management right of the Community is read-write and changes can be made to the corresponding View.

MIB View: Select the MIB View for the community to access.

➤ **Community Table**

Select: Select the desired entry to delete the corresponding Community. It is multi-optional.

Community Name: Displays the Community Name here.

Access: Displays the right of the Community to access the View.

MIB View: Displays the Views which the Community can access.

Operation: Click the **Edit** button to modify the MIB View and the Access right of the Community, and then click the **Modify** button to apply.

Note:

The default MIB View of SNMP Community is viewDefault.

Configuration Procedure:

- If SNMPv3 is employed, please take the following steps:

Step	Operation	Description
1	Enable SNMP function globally.	Required. On the SNMP→SNMP Config→Global Config page, enable SNMP function globally.
2	Create SNMP View.	Required. On the SNMP→SNMP Config→SNMP View page, create SNMP View of the management agent. The default View Name is viewDefault and the default OID is 1.
3	Create SNMP Group.	Required. On the SNMP→SNMP Config→SNMP Group page, create SNMP Group for SNMPv3 and specify SNMP Views with various access levels for SNMP Group.
4	Create SNMP User.	Required. On the SNMP→SNMP Config→SNMP User page, create SNMP User in the Group and configure the auth/privacy mode and auth/privacy password for the User.

- If SNMPv1 or SNMPv2c is employed, please take the following steps:

Step	Operation	Description				
1	Enable SNMP function globally.	Required. On the SNMP→SNMP Config→Global Config page, enable SNMP function globally.				
2	Create SNMP View.	Required. On the SNMP→SNMP Config→SNMP View page, create SNMP View of the management agent. The default View Name is viewDefault and the default OID is 1.				
3	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; vertical-align: top;">Create SNMP Community directly.</td> <td style="width: 50%;"></td> </tr> <tr> <td style="vertical-align: top;">Configure access level for the User.</td> <td style="vertical-align: top;">Create SNMP Group and SNMP User.</td> </tr> </table>	Create SNMP Community directly.		Configure access level for the User.	Create SNMP Group and SNMP User.	<p>Required alternatively.</p> <ul style="list-style-type: none"> • Create SNMP Community directly. On the SNMP→SNMP Config→SNMP Community page, create SNMP Community based on SNMP v1 and SNMP v2c. • Create SNMP Group and SNMP User. Similar to the configuration way based on SNMPv3, you can create SNMP Group and SNMP User of SNMP v1/v2c. The User name can limit access to the SNMP agent from SNMP network management station, functioning as a community name. The users can manage the device via the Read View, Write View and Notify View defined in the SNMP Group.
Create SNMP Community directly.						
Configure access level for the User.	Create SNMP Group and SNMP User.					

12.2 Notification

With the Notification function enabled, the switch can initiatively report to the management station about the important events that occur on the Views (e.g., the managed device is rebooted), which allows the management station to monitor and process the events in time.

The notification information includes the following two types:

Trap: Trap is the information that the managed device initiatively sends to the Network management station without request.

Inform: Inform packet is sent to inform the management station and ask for the reply. The switch will resend the inform request if it doesn't get the response from the management station during the Timeout interval, and it will terminate resending the inform request if the resending times reach the specified Retry times. The Inform type, employed on SNMPv2c and SNMPv3, has a higher security than the Trap type.

On this page, you can configure the notification function of SNMP.

Choose the menu **SNMP**→**Notification**→**Notification Config** to load the following page.

Select	IP Address	UDP Port	User	Security Model	Security Level	Type	Timeout	Retry	Operation
		162		v1	noAuthNoPriv	Trap			

Figure 12-8 Notification Config

The following entries are displayed on this screen:

➤ Create Notification

- IP Address:** Enter the IP Address of the management Host.
- UDP Port:** Enter the number of the UDP port used to send notifications. The UDP port functions with the IP address for the notification sending. The default is 162.
- User:** Enter the User name of the management station.
- Security Model:** Select the Security Model of the management station.
- Security Level:** Select the Security Level for the SNMP v3 User.
- **noAuthNoPriv:** No authentication and no privacy security level are used.
 - **authNoPriv:** Only the authentication security level is used.
 - **authPriv:** Both the authentication and the privacy security levels are used.

Type:	Select the type for the notifications. <ul style="list-style-type: none"> • Trap: Indicates traps are sent. • Inform: Indicates informs are sent. The Inform type has a higher security than the Trap type.
Retry:	Specify the amount of times the switch resends an inform request. The switch will resend the inform request if it doesn't get the response from the management station during the Timeout interval, and it will terminate resending the inform request if the resending times reach the specified Retry times.
Timeout:	Specify the maximum time for the switch to wait for the response from the management station before resending a request.

➤ **Notification Table**

Select:	Select the desired entry to delete the corresponding management station.
IP Address:	Displays the IP Address of the management host.
UDP Port:	Displays the UDP port used to send notifications.
User:	Displays the User name of the management station.
Security Model:	Displays the Security Model of the management station.
Security Level:	Displays the Security Level for the SNMP v3 User.
Type:	Displays the type of the notifications.
Timeout:	Displays the maximum time for the switch to wait for the response from the management station before resending a request.
Retry:	Displays the amount of times the switch resends an inform request.
Operation:	Click the Edit button to modify the corresponding entry and click the Modify button to apply.

12.3 RMON

RMON (Remote Monitoring) basing on SNMP (Simple Network Management Protocol) architecture, functions to monitor the network. RMON is currently a commonly used network management standard defined by Internet Engineering Task Force (IETF), which is mainly used to monitor the data traffic across a network segment or even the entire network so as to enable the network administrator to take the protection measures in time to avoid any network malfunction. In addition, RMON MIB records network statistics information of network performance and malfunction periodically, based on which the management station can monitor network at any time effectively. RMON is helpful for network administrator to manage the large-scale network since it reduces the communication traffic between management station and managed agent.

➤ **RMON Group**

This switch supports the following four RMON Groups defined on the RMON standard (RFC1757): History Group, Event Group, Statistic Group and Alarm Group.

RMON Group	Function
History Group	After a history group is configured, the switch collects and records network statistics information periodically, based on which the management station can monitor network effectively.
Event Group	Event Group is used to define RMON events. Alarms occur when an event is detected.
Statistic Group	Statistic Group is set to monitor the statistic of alarm variables on the specific ports.
Alarm Group	Alarm Group is configured to monitor the specific alarm variables. When the value of a monitored variable exceeds the threshold, an alarm event is generated, which triggers the switch to act in the set way.

The **RMON** Groups can be configured on the **History Control**, **Event Config** and **Alarm Config** pages.

12.3.1 History Control

On this page, you can configure the History Group for RMON.

Choose the menu **SNMP**→**RMON**→**History Control** to load the following page.

History Control Table					
Select	Index	Port	Interval (sec)	Owner	Status
<input type="checkbox"/>		Port 1			Disable
<input type="checkbox"/>	1	Port 1	1800	monitor	Disable
<input type="checkbox"/>	2	Port 2	1800	monitor	Disable
<input type="checkbox"/>	3	Port 3	1800	monitor	Disable
<input type="checkbox"/>	4	Port 4	1800	monitor	Disable
<input type="checkbox"/>	5	Port 5	1800	monitor	Disable
<input type="checkbox"/>	6	Port 6	1800	monitor	Disable
<input type="checkbox"/>	7	Port 7	1800	monitor	Disable
<input type="checkbox"/>	8	Port 8	1800	monitor	Disable
<input type="checkbox"/>	9	Port 9	1800	monitor	Disable
<input type="checkbox"/>	10	Port 10	1800	monitor	Disable
<input type="checkbox"/>	11	Port 11	1800	monitor	Disable
<input type="checkbox"/>	12	Port 12	1800	monitor	Disable

Figure 12-9 History Control

The following entries are displayed on this screen:

➤ **History Control Table**

- Select:** Select the desired entry for configuration.
- Index:** Displays the index number of the entry.
- Port:** Specify the port from which the history samples were taken.
- Interval:** Specify the interval to take samplings from the port.
- Owner:** Enter the name of the device or user that defined the entry.
- Status:** Select Enable/Disable the corresponding sampling entry.

12.3.2 Event Config

On this page, you can configure the RMON events.

Choose the menu **SNMP**→**RMON**→**Event Config** to load the following page.

Event Table						
Select	Index	User	Description	Type	Owner	Status
<input type="checkbox"/>		<input type="text"/>	<input type="text"/>	None	<input type="text"/>	Disable
<input type="checkbox"/>	1	public		None	monitor	Disable
<input type="checkbox"/>	2	public		None	monitor	Disable
<input type="checkbox"/>	3	public		None	monitor	Disable
<input type="checkbox"/>	4	public		None	monitor	Disable
<input type="checkbox"/>	5	public		None	monitor	Disable
<input type="checkbox"/>	6	public		None	monitor	Disable
<input type="checkbox"/>	7	public		None	monitor	Disable
<input type="checkbox"/>	8	public		None	monitor	Disable
<input type="checkbox"/>	9	public		None	monitor	Disable
<input type="checkbox"/>	10	public		None	monitor	Disable
<input type="checkbox"/>	11	public		None	monitor	Disable
<input type="checkbox"/>	12	public		None	monitor	Disable

Figure 12-10 Event Config

The following entries are displayed on this screen:

➤ Event Table

- Select:** Select the desired entry for configuration.
- Index:** Displays the index number of the entry.
- User:** Enter the name of the User or the community to which the event belongs.
- Description:** Give a description to the event for identification.
- Type:** Select the event type, which determines the act way of the network device in response to an event.
- **None:** No processing.
 - **Log:** Logging the event.
 - **Notify:** Sending trap messages to the management station.
 - **Log&Notify:** Logging the event and sending trap messages to the management station.
- Owner:** Enter the name of the device or user that defined the entry.
- Status:** Select Enable/Disable the corresponding event entry.

12.3.3 Alarm Config

On this page, you can configure Statistic Group and Alarm Group for RMON.

Choose the menu **SNMP**→**RMON**→**Alarm Config** to load the following page.

Select	Index	Variable	Port	Sample Type	Rising Threshold	Rising Event	Falling Threshold	Falling Event	Alarm Type	Interval (sec)	Owner	Status
<input type="checkbox"/>		DropEvents		Absolute					All			Disable
<input type="checkbox"/>	1	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable
<input type="checkbox"/>	2	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable
<input type="checkbox"/>	3	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable
<input type="checkbox"/>	4	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable
<input type="checkbox"/>	5	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable
<input type="checkbox"/>	6	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable
<input type="checkbox"/>	7	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable
<input type="checkbox"/>	8	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable
<input type="checkbox"/>	9	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable
<input type="checkbox"/>	10	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable
<input type="checkbox"/>	11	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable
<input type="checkbox"/>	12	DropEvents	Port 1	Absolute	100	1	100	1	All	1800	monitor	Disable

Figure 12-11 Alarm Config

The following entries are displayed on this screen:

➤ **Alarm Table**

- Select:** Select the desired entry for configuration.
- Index:** Displays the index number of the entry.
- Variable:** Select the alarm variables from the pull-down list.
- Port:** Select the port on which the Alarm entry acts.
- Sample Type:** Specify the sampling method for the selected variable and comparing the value against the thresholds.
- **Absolute:** Compares the values directly with the thresholds at the end of the sampling interval.
 - **Delta:** Subtracts the last sampled value from the current value. The difference in the values is compared to the threshold.
- Rising Threshold:** Enter the rising counter value that triggers the Rising Threshold alarm.
- Rising Event:** Select the index of the corresponding event which will be triggered if the sampled value is larger than the Rising Threshold.
- Falling Threshold:** Enter the falling counter value that triggers the Falling Threshold alarm.
- Falling Event:** Select the index of the corresponding event which will be triggered if the sampled value is lower than the Falling Threshold.
- Alarm Type:** Specify the type of the alarm.
- **All:** The alarm event will be triggered either the sampled value exceeds the Rising Threshold or is under the Falling Threshold.
 - **Rising:** When the sampled value exceeds the Rising Threshold, an alarm event is triggered.
 - **Falling:** When the sampled value is under the Falling Threshold, an alarm event is triggered.
- Interval:** Enter the alarm interval time in seconds.

Owner: Enter the name of the device or user that defined the entry.

Status: Select Enable/Disable the corresponding alarm entry.

Note:

When alarm variables exceed the Threshold on the same direction continuously for several times, an alarm event will only be generated on the first time, that is, the Rising Alarm and Falling Alarm are triggered alternately for that the alarm following to Rising Alarm is certainly a Falling Alarm and vice versa.

[Return to CONTENTS](#)

Chapter 13 LLDP

LLDP (Link Layer Discovery Protocol) is a Layer 2 protocol that is used for network devices to advertise their own device information periodically to neighbors on the same IEEE 802 local area network. The advertised information, including details such as device identification, capabilities and configuration settings, is represented in TLV (Type/Length/Value) format according to the IEEE 802.1ab standard, and these TLVs are encapsulated in LLDPDU (Link Layer Discovery Protocol Data Unit). The LLDPDU distributed via LLDP is stored by its recipients in a standard MIB (Management Information Base), making it possible for the information to be accessed by a Network Management System (NMS) using a management protocol such as the Simple Network Management Protocol (SNMP).

An IETF Standard MIB, as well as a number of vendor specific MIBs, have been created to describe a network's physical topology and associated systems within that topology. However, there is no standard protocol for populating these MIBs or communicating this information among stations on the IEEE 802 LAN. LLDP protocol specifies a set. The device running LLDP can automatically discover and learn about the neighbors, allowing for interoperability between the network devices of different vendors. This protocol allows two systems running different network layer protocols to learn about each other.

The LLDP information can be used by SNMP applications to simplify troubleshooting, enhance network management, and maintain an accurate network topology.

➤ LLDPDU Format

Each LLDPDU includes an ordered sequence of three mandatory TLVs followed by one or more optional TLVs plus an End of LLDPDU TLV, as shown in the figure below. Chassis ID TLV, Port ID TLV, TTL TLV and End TLV are the four mandatory TLVs for a LLDPDU. Optional TLVs provide various details about the LLDP agent advertising them and they are selected by network management.

M - mandatory TLV - required for all LLDPDUs

The maximum length of the LLDPDU shall be the maximum information field length allowed by the particular transmission rate and protocol. In IEEE 802.3 MACs, for example, the maximum LLDPDU length is the maximum data field length for the basic, untagged MAC frame (1500 octets).

➤ LLDP Working Mechanism

1) LLDP Admin Status

The transmission and the reception of LLDPDUs can be separately enabled for every port, making it possible to configure an implementation to restrict the port either to transmit only or receive only, or to allow the port to both transmit and receive LLDPDUs. Four LLDP admin statuses are supported by each port.

- Tx&Rx: the port can both transmit and receive LLDPDUs.
- Rx_Only: the port can receive LLDPDUs only.
- Tx_Only: the port can transmit LLDPDUs only.

- Disable: the port cannot transmit or receive LLDPDU.

2) LLDPDU transmission mechanism

- If the ports are working in TxRx or Tx mode, they will advertise local information by sending LLDPDUs periodically.
- If there is a change in the local device, the change notification will be advertised. To prevent a series of successive LLDPDUs transmissions during a short period due to frequent changes in local device, a transmission delay timer is set by network management to ensure that there is a defined minimum time between successive LLDP frame transmissions.
- If the LLDP admin status of the port is changed from Disable/Rx to TxRx/Tx, the Fast Start Mechanism will be active, the transmit interval turns to be 1 second, several LLDPDUs will be sent out, and then the transmit interval comes back to the regular interval.

3) LLDPDU receipt mechanism

When a port is working in TxRx or Rx mode, the device will check the validity of the received LLDPDUs and the attached TLVs, save this neighbor information to the local device and then set the aging time of this information according to the TTL value of TTL (Time To Live) TLV. Once the TTL is 0, this neighbor information will be aged out immediately.

The aging time of the local information in the neighbor device is determined by TTL. Hold Multiplier is a multiplier on the Transmit Interval that determines the actual TTL value used in an LLDPDU. $TTL = Hold Multiplier * Transmit Interval$.

➤ TLV

TLV refers to Type/Length/Value and is contained in a LLDPDU. Type identifies what kind of information is being sent, Length indicates the length of information string in octets and Value is the actual information to be sent. The basic TLV Format is shown as follows:

Each TLV is identified by a unique TLV type value that indicates the particular kind of information contained in the TLV.

The following table shows the details about the currently defined TLVs.

TLV Type	TLV Name	Description	Usage in LLDPDU
0	End of LLDPDU	Mark the end of the TLV sequence in LLDPDUs. Any information following an End Of LLDPDU TLV shall be ignored.	Mandatory
1	Chassis ID	Identifies the Chassis address of the connected device.	Mandatory
2	Port ID	Identifies the MAC address of the specific port that transmitted the LLDP frame.	Mandatory

TLV Type	TLV Name	Description	Usage in LLDPDU
3	Time To Live	Indicates the number of seconds that the neighbor device is to regard the local information to be valid.	Mandatory
4	Port Description	Identifies the description string of the port.	Optional
5	System Name	Identifies the system name.	Optional
6	System Description	Identifies the system description.	Optional
7	System Capabilities	Identifies the main functions of the system and the functions enabled.	Optional
8	Management Address	Identifies the management IP address, the corresponding interface number and OID (Object Identifier). The management IP address is specified by the user.	Optional
127	Organizationally Specific	Allows different organizations, such as IEEE 802.1, IEEE 802.3, IETF, as well as individual software and equipment vendors, to define TLVs that advertise information to remote device.	Optional

Optional TLVs are grouped into two categories including basic management TLV and Organizationally-specific TLV.

1) Basic Management TLV

A set of TLVs considered to be basic to the management of the network stations are required for all LLDP implementations.

2) Organizationally Specific TLV

Different organizations have defined various TLVs. For instance, Port VLAN ID TLV, Port and Protocol VLAN ID TLV, VLAN Name TLV And Protocol Identity TLV are defined by IEEE 802.1, while MAC/PHY Configuration/Status TLV, Power Via MDI TLV, Link Aggregation TLV and Maximum Frame TLV are defined by IEEE 802.3.

Note:

For detailed introduction of TLV, please refer to IEEE 802.1AB standard.

In TP-LINK switch, the following LLDP optional TLVs are supported.

Port Description TLV	The Port Description TLV allows network management to advertise the IEEE 802 LAN station's port description.
System Capabilities TLV	The System Capabilities TLV identifies the primary functions of the system and whether or not these primary functions are enabled.
System Description TLV	The System Description TLV allows network management to advertise the system's description, which should include the full name and version identification of the system's hardware type, software operating system, and networking software.

System Name TLV	The System Name TLV allows network management to advertise the system's assigned name, which should be the system's fully qualified domain name.
Management Address TLV	The Management Address TLV identifies an address associated with the local LLDP agent that may be used to reach higher entities to assist discovery by network management.
Port VLAN ID TLV	The Port VLAN ID TLV allows a VLAN bridge port to advertise the port's VLAN identifier (PVID) that will be associated with untagged or priority tagged frames.
Port And Protocol VLAN ID TLV	The Port And Protocol VLAN ID TLV allows a bridge port to advertise a port and protocol VLAN ID.
VLAN Name TLV	The VLAN Name TLV allows an IEEE 802.1Q-compatible IEEE 802 LAN station to advertise the assigned name of any VLAN with which it is configured.
Link Aggregation TLV	The Link Aggregation TLV indicates whether the link is capable of being aggregated, whether the link is currently in an aggregation, and if in an aggregation, the port identification of the aggregation.
MAC/PHY Configuration/Status TLV	The MAC/PHY Configuration/Status TLV identifies: a)The duplex and bit-rate capability of the sending IEEE 802.3 LAN node that is connected to the physical medium; b)The current duplex and bit-rate settings of the sending IEEE 802.3 LAN node; c)Whether these settings are the result of auto-negotiation during link initiation or of manual set override action.
Max Frame Size TLV	The Maximum Frame Size TLV indicates the maximum frame size capability of the implemented MAC and PHY.
Power Via MDI TLV	The Power Via MDI TLV allows network management to advertise and discover the MDI power support capabilities of the sending IEEE 802.3 LAN station.

The LLDP module is mainly for LLDP function configuration of the switch, including three submenus: **Basic Config**, **Device Info** and **Device Statistics**.

13.1 Basic Config

LLDP is configured on the **Global Config** and **Port Config** pages.

13.1.1 Global Config

On this page you can configure the LLDP parameters of the device globally.

Choose the menu **LLDP**→**Basic Config**→**Global Config** to load the following page.

Global Config	
LLDP:	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
<input type="button" value="Apply"/>	
Parameters Config	
Transmit Interval:	<input type="text" value="30"/> sec(5-32768)
Hold Multiplier:	<input type="text" value="4"/> (2-10)
Transmit Delay:	<input type="text" value="2"/> sec(1-8192)
Reinit Delay:	<input type="text" value="3"/> sec(1-10)
Notification Interval:	<input type="text" value="5"/> sec(5-3600)
Fast Start Count:	<input type="text" value="3"/> (1-10)
<input type="button" value="Apply"/>	
<input type="button" value="Help"/>	

Figure 13-1 Global Configuration

The following entries are displayed on this screen:

➤ **Global Config**

LLDP: Enable/disable LLDP function globally.

➤ **Parameters Config**

Transmit Interval: Enter the interval for the local device to transmit LLDPDU to its neighbors. The default value is 30.

Hold Multiplier: Enter a multiplier on the Transmit Interval. It determines the actual TTL (Time To Live) value used in an LLDPDU. $TTL = Hold\ Multiplier * Transmit\ Interval$. The default value is 4.

Transmit Delay: Enter a value from 1 to 8192 in seconds to specify the time for the local device to transmit LLDPDU to its neighbors after changes occur so as to prevent LLDPDU being sent frequently. The default value is 2.

Reinit Delay: This parameter indicates the amount of delay from when LLDP status becomes "disable" until re-initialization will be attempted. The default value is 3.

Notification Interval: Specify the interval of Trap message which will be sent from local device to network management system. The default value is 5.

Fast Start Count: When the port's LLDP state transforms from Disable (or Rx_Only) to Tx&Rx (or Tx_Only), the fast start mechanism will be enabled, that is, the transmit interval will be shorten to a second, and several LLDPDUs will be sent out (the number of LLDPDUs equals this parameter). The default value is 3.

13.1.2 Port Config

On this page you can configure all ports' LLDP parameters.

Choose the menu **LLDP**→**Basic Config**→**Port Config** to load the following page.

LLDP Port Config

Port

Select	Port	Admin Status	Notification Mode	Included TLVs
<input type="checkbox"/>		Disable ▾	Disable ▾	
<input type="checkbox"/>	1	Tx&Rx	Disable	Detail
<input type="checkbox"/>	2	Tx&Rx	Disable	Detail
<input type="checkbox"/>	3	Tx&Rx	Disable	Detail
<input type="checkbox"/>	4	Tx&Rx	Disable	Detail
<input type="checkbox"/>	5	Tx&Rx	Disable	Detail
<input type="checkbox"/>	6	Tx&Rx	Disable	Detail
<input type="checkbox"/>	7	Tx&Rx	Disable	Detail
<input type="checkbox"/>	8	Tx&Rx	Disable	Detail
<input type="checkbox"/>	9	Tx&Rx	Disable	Detail
<input type="checkbox"/>	10	Tx&Rx	Disable	Detail
<input type="checkbox"/>	11	Tx&Rx	Disable	Detail
<input type="checkbox"/>	12	Tx&Rx	Disable	Detail
<input type="checkbox"/>	13	Tx&Rx	Disable	Detail
<input type="checkbox"/>	14	Tx&Rx	Disable	Detail

Figure 13-2 Port Configuration

The following entries are displayed on this screen:

➤ **LLDP Port Config**

Port Select: Select the desired port to configure.

Admin Status: Select the port's LLDP operating mode:

- **Tx&Rx:** Send and receive LLDP frames.
- **Rx_Only:** Only receive LLDP frames.
- **Tx_Only:** Only send LLDP frames.
- **Disable:** Neither send nor receive LLDP frames.

Notification Mode: Enable/Disable the ports' SNMP notification. If enabled, the local device will notify the trap event to SNMP server.

Included TLVs: Select TLVs to be included in outgoing LLDPDU.

Details: Click Details to display the included TLVs.

13.2 Device Info

You can view the LLDP information of the local device and its neighbors on the **Local Info** and **Neighbor Info** pages respectively.

13.2.1 Local Info

On this page you can see all ports' configuration and system information.

Choose the menu **LLDP**→**Device Info**→**Local Info** to load the following page.

Chapter 14 Cluster

With the development of network technology, the network scale is getting larger and more network devices are required, which may result in a more complicated network management system. As a large number of devices need to be assigned different network addresses and every management device needs to be respectively configured to meet the application requirements, manpower are needed.

The Cluster Management function can solve the above problem. It is mainly used to central manage the scattered devices in the network. A network administrator can manage and maintain the switches in the cluster via a management switch. The management switch is the commander of the cluster and the others are member switches.

The typical topology is as follows.

Figure 14-1 Cluster topology

➤ Cluster Role

According to their functions and status in a cluster, switches in the cluster play different roles. You can specify the role a switch plays. There are four roles.

Commander Switch: Indicates the device that can configure and manage all the devices in a cluster. It discovers and determines the candidate switches by collecting NDP (Neighbor Discovery Protocol) and NTDP (Neighbor Topology Discovery Protocol).

Member Switch: Indicates the device that is managed in a cluster.

Candidate Switch: Indicates the device that does not belong to any cluster though it can be added to a cluster.

Individual Switch: Indicates the device with cluster feature disabled.

The roles can be changed from one to another following the specified rules.

- The current switch you create cluster is specified as the commander switch.

- The commander switch discovers and determines candidate switches by collecting related information.
- After being added to the cluster, the candidate switch becomes to be the member switch.
- After being removed from the cluster, the member switch becomes to be the candidate switch.
- The commander switch becomes to be the candidate switch only when the cluster is deleted.

➤ **Introduction to Cluster**

Cluster functions to configure and manage the switches in the cluster based on three protocols, NDP, NTDP and CMP (Cluster Management Protocol).

- NDP: All switches get neighbor information by collecting NDP.
- NTDP: The commander switch collects the NDP information and neighboring connection information of each device in a specific network range to determine the candidate switches in the cluster.

Cluster maintenance: The commander switch adds the candidate switch to the cluster and removes the member switch from the cluster according to the collected NTDP information.

The Cluster module, mainly used for cluster management configuration, including three submenus: **NDP**, **NTDP**, **Cluster** and **Batch Management**.

14.1 NDP

NDP (Neighbor Discovery Protocol) is used to get the information of the directly connected neighbor devices to support cluster establishing. An NDP-enabled device sends NDP packets regularly to neighbor devices as well as receives NDP packets from neighbor devices. An NDP packet carries the NDP information (including the device name, MAC address, firmware version and so on).

A switch keeps and maintains a neighbor information table, which contains the NDP information of each neighbor switch. If a switch receives the NDP information of a new neighbor, it will add the information to the neighbor information table. If the received NDP information is different from the old information, the switch will update it in the neighbor information table; if the received NDP information is the same with the old information, the switch will just update the aging time; if the switch does not receive NDP information within the aging time, the switch will remove the corresponding information from the table automatically.

The NDP function can be implemented on **Neighbor Info**, **NDP Summary** and **NDP Config** pages.

14.1.1 Neighbor Info

On this page you can view the NDP neighbor information of the switch.

Choose the menu **Cluster**→**NDP**→**Neighbor Info** to load the following page.

The screenshot shows a web interface for 'Neighbor Search' and 'Neighbor Info'. The 'Neighbor Search' section has a 'Search Option' dropdown set to 'All', a search input field, and a 'Search' button. The 'Neighbor Info' section features a table with the following headers: Native Port, Remote Port, Device Name, Device MAC, Firmware Version, and Aging Time(sec). Below the table are 'Refresh' and 'Help' buttons.

Figure 14-2 Neighbor Information

The following entries are displayed on this screen:

➤ **Neighbor**

Search Option: Select the information the desired entry should contain and then click the **Search** button to display the desired entry in the following Neighbor Information table.

➤ **Neighbor Info**

Native Port: Displays the port number of the switch.

Remote Port: Displays the port number of the neighbor switch which is connected to the corresponding port.

Device Name: Displays the name of the neighbor switch.

Device MAC: Displays MAC address of the neighbor switch.

Firmware Version: Displays the firmware version of the neighbor switch.

Aging Time: Displays the period for the switch s to keep the NDP packets from the neighbor switch.

14.1.2 NDP Summary

On this page you can view the NDP configuration of the switch.

Choose the menu **Cluster**→**NDP**→**NDP Summary** to load the following page.

Global Config						
NDP:	Enable					
Aging Time:	180sec					
Hello Time:	60sec					
Port Status						
Port	NDP	Send NDP Packets	Receive NDP Packets	Error NDP Packets	Neighbors	Detail
1	Enable	0	0	0	0	Detail
2	Enable	83	106	0	3	Detail
3	Enable	0	0	0	0	Detail
4	Enable	0	0	0	0	Detail
5	Enable	0	0	0	0	Detail
6	Enable	83	0	0	0	Detail
7	Enable	0	0	0	0	Detail
8	Enable	0	0	0	0	Detail
9	Enable	0	0	0	0	Detail
10	Enable	0	0	0	0	Detail
11	Enable	0	0	0	0	Detail
12	Enable	0	0	0	0	Detail

Figure 14-3 NDP Summary

The following entries are displayed on this screen:

➤ **Global Config**

NDP: Displays the global NDP status (enabled or disabled) for the switch.

Aging Time: Displays the period for the neighbor switch to keep the NDP packets from this switch.

Hello Time: Displays the interval to send NDP packets.

➤ **Port Status**

Port: Displays the port number of the switch.

NDP: Displays the NDP status (enabled or disabled) for the current port.

Send NDP Packets: Displays the count of currently sent NDP packets.

Receive NDP Packets: Displays the count of currently received NDP packets.

Error NDP Packets: Displays the count of currently received error NDP packets.

Neighbors: Displays the count of the connected neighbors.

Detail: Click the **Detail** button to view the complete information collected for the port.

14.1.3 NDP Config

On this page you can configure the NDP function for the switch.

Choose the menu **Cluster**→**NDP**→**NDP Config** to load the following page.

Global Config

NDP: Enable Disable

Aging Time: sec (5-255, default: 180)

Hello Time: sec (5-254, default: 60)

Port Config

Select	Port	NDP	Select	Port	NDP
<input type="checkbox"/>	1	Enable	<input type="checkbox"/>	2	Enable
<input type="checkbox"/>	3	Enable	<input type="checkbox"/>	4	Enable
<input type="checkbox"/>	5	Enable	<input type="checkbox"/>	6	Enable
<input type="checkbox"/>	7	Enable	<input type="checkbox"/>	8	Enable
<input type="checkbox"/>	9	Enable	<input type="checkbox"/>	10	Enable
<input type="checkbox"/>	11	Enable	<input type="checkbox"/>	12	Enable
<input type="checkbox"/>	13	Enable	<input type="checkbox"/>	14	Enable
<input type="checkbox"/>	15	Enable	<input type="checkbox"/>	16	Enable
<input type="checkbox"/>	17	Enable	<input type="checkbox"/>	18	Enable
<input type="checkbox"/>	19	Enable	<input type="checkbox"/>	20	Enable
<input type="checkbox"/>	21	Enable	<input type="checkbox"/>	22	Enable
<input type="checkbox"/>	23	Enable	<input type="checkbox"/>	24	Enable
<input type="checkbox"/>	25	Enable	<input type="checkbox"/>	26	Enable
<input type="checkbox"/>	27	Enable	<input type="checkbox"/>	28	Enable

Figure 14-4 NDP Config

The following entries are displayed on this screen:

➤ **Global Config**

NDP: Select Enable/Disable NDP function globally.

Aging Time: Enter the period for the neighbor switch to keep the NDP packets from this switch.

Hello Time: Enter the interval to send NDP packets.

➤ **Port Config**

Select: Select the desired port to configure its NDP status.

Port: Displays the port number of the switch.

NDP: Displays NDP status of the current port.

Enable: Click the **Enable** button to enable NDP for the port you select.

Disable: Click the **Disable** button to disable NDP for the port you select.

Note:

1. NDP function is effective only when NDP function is enabled globally and for the port.
2. The aging time should be set over the hello time value, otherwise this setting will be invalid and will not take effect.

14.2 NTDP

NTDP (Neighbor Topology Discovery Protocol) is used for the commander switch to collect NDP information. NTDP transmits and forwards NTDP topology collection request based on NDP neighbor information table, and collects the NDP information and neighboring connection information of each device in a specific network range. The commander switch can collect the specified topology in the network regularly and you can also enable topology collection manually on the commander switch.

After the commander switch sends out NTDP request packets, lots of switches receive the request packets and send out response packets at the same time, which may result in network congestion and the commander switch overload. To avoid the above problem, two time parameters are designed to control the spread speed of NTDP request packets.

- **NTDP hop delay:** Indicates the time between the switch receiving NTDP request packets and the switch forwarding NTDP request packets for the first time.
- **NTDP port delay:** Indicates the time between the port forwarding NTDP request packets and its adjacent port forwarding NTDP request packets over.

The NTDP function can be implemented on **Device Table**, **NTDP Summary** and **NTDP Config** pages.

14.2.1 Device Table

On this page you can view the information of the devices collected by NTDP. Meanwhile, no matter whether a cluster is established, on this page you can manually collect NTDP information at any time to manage and control devices.

Choose the menu **Cluster**→**NTDP**→**Device Table** to load the following page.

Device Type	Device MAC	Cluster Name	Role	Hops	Neighbor Info
TL-SG3210 2.0	00-14-78-00-00-CA	TP	Member	1	Detail
TL-SL5428E 2.0	00-00-00-54-28-02	TP	Commander	0	Detail

Figure 14-5 Device Table

The following entries are displayed on this screen:

➤ **Device Table**

- Device Type:** Displays the device description collected through NTDP.
- Device MAC:** Displays the MAC address of this device.
- Cluster Name:** Displays the cluster name of this device.
- Role:** Displays the role this device plays in the cluster.
- **Commander:** Indicates the device that can configure and manage all the devices in a cluster.
 - **Member:** Indicates the device that is managed in a cluster.
 - **Candidate:** Indicates the device that does not belong to any cluster though it can be added to a cluster.
 - **Individual:** Indicates the device with cluster feature disabled.
- Hops:** Displays the hop count from this device to the switch.

Neighbor Info: Click the **Detail** button to view the complete information of this device and its neighbors.

Collect Topology: Click the **Collect Topology** button to collect NTDP information of the switch so as to collect the latest network topology.

Click the **Detail** button to view the complete information of this device and its neighbors.

Current Device Info

Device Name: TP_0.TL-SL5428E
MAC: 00-00-00-54-28-02
Hops: 0
Device Type: TL-SL5428E 2.0

Figure 14-7 NTDP Summary

The following entries are displayed on this screen:

➤ **Global Config**

- NTDP:** Displays the NTDP status (enabled or disabled) of the switch globally.
- NTDP Interval Time:** Displays the interval to collect topology information.
- NTDP Hops:** Displays the hop count the switch topology collects.
- NTDP Hop Delay:** Displays the time between the switch receiving NTDP request packets and the switch forwarding NTDP request packets for the first time.
- NTDP Port Delay:** Displays the time between the port forwarding NTDP request packets and its adjacent port forwarding NTDP request packets over.

➤ **Port Status**

- Port:** Displays the port number of the switch.
- NTDP:** Displays NTDP status (enabled or disabled) of the current port.

14.2.3 NTDP Config

On this page you can configure NTDP globally.

Choose the menu **Cluster**→**NTDP**→**NTDP Config** to load the following page.

Global Config

NTDP: Enable Disable

NTP Interval Time: min (1-60, default: 1)

NTDP Hops: hop (1-16, default: 3) Apply

NTDP Hop Delay: ms (1-1000, default: 200)

NTDP Port Delay: ms (1-100, default: 20)

Port Config

Select	Port	NTDP	Select	Port	NTDP
<input type="checkbox"/>	1	Enable	<input type="checkbox"/>	2	Enable
<input type="checkbox"/>	3	Enable	<input type="checkbox"/>	4	Enable
<input type="checkbox"/>	5	Enable	<input type="checkbox"/>	6	Enable
<input type="checkbox"/>	7	Enable	<input type="checkbox"/>	8	Enable

Figure 14-8 NTDP Config

The following entries are displayed on this screen:

➤ **Global Config**

- NTDP:** Select Enable/Disable NTDP for the switch globally.
- NTDP Interval Time:** Enter the interval to collect topology information. The default is 1 minute.
- NTDP Hops:** Enter the hop count the switch topology collects. The default is 3 hops.
- NTDP Hop Delay:** Enter the time between the switch receiving NTDP request packets and the switch forwarding NTDP request packets for the first time. The default is 200 milliseconds.
- NTDP Port Delay:** Enter the time between the port forwarding NTDP request packets and its adjacent port forwarding NTDP request packets over. The default is 20 milliseconds.

➤ **Port Config**

- Select:** Select the desired port for NTDP status configuration.
- Port:** Displays the port number of the switch.

- NTDP:** Displays NTDP status (enabled or disabled) of the current port.
- Enable:** Click the **Enable** button to enable NTDP feature for the port you select.
- Disable:** Click the **Disable** button to disable NTDP feature for the port you select.

Note:

NTDP function is effective only when NTDP function is enabled globally and for the port.

14.3 Cluster

A commander switch can recognize and add the candidate switch to a cluster automatically based on NDP and NTDP. You can manually add the candidate switch to a cluster. If the candidate switch is successfully added to the cluster, it will get a private IP address assigned by the commander switch. You can manage and configure the member switch via the commander switch.

The Cluster function can be implemented on **Cluster Summary**, **Cluster Config**, **Member Config** and **Cluster Topology** pages.

14.3.1 Cluster Summary

On this page you can view the status of the current cluster.

Choose the menu **Cluster**→**Cluster**→**Cluster Summary** to load the following page.

- For a candidate switch, the following page is displayed:

Figure 14-9 Cluster Summary for Candidate Switch

The following entries are displayed on this screen:

➤ **Global Config**

- Cluster:** Displays the cluster status (enabled or disabled) of the switch.
- Cluster Role:** Displays the role the switch plays in the cluster.

- For a commander switch, the following page is displayed:

Global Config						
Cluster:	Enable					
Cluster Role:	Commander					
Cluster Name:	TP					

Cluster Config

➤ **Role Change**

Candidate: Select this option to change the role of the switch to be candidate switch.

14.3.3 Member Config

When this switch is the commander switch of the cluster, via the commander switch you can manually add a candidate switch to the cluster as well as remove the designated member switch from the cluster. On this page you can configure and manage the member switch.

Choose the menu **Cluster**→**Cluster**→**Member Config** to load the following page.

The screenshot shows a web interface for managing cluster members. At the top, there is a 'Create Member' section with a text input field for 'Member MAC' and a 'Create' button. Below this is a 'Member Info' table with columns for Select, Device Name, Member MAC, IP Address, Status, Role, Online Time, and Hops. The table contains one entry for 'TP_1.TL-SG32 10' with a status of 'Online' and role of 'Member'. Below the table are buttons for 'Manage', 'Delete', 'Refresh', and 'Help'.

Select	Device Name	Member MAC	IP Address	Status	Role	Online Time	Hops
<input type="checkbox"/>	TP_1.TL-SG32 10	00-14-78-00-00-CA	192.168.1.2	Online	Member	0:00:19	1

Figure 14-17 Member Config

The following entries are displayed on this screen:

➤ **Create Member**

Member MAC: Enter the MAC address of the candidate switch.

➤ **Member Info**

Select: Select the desired entry to manage/delete the corresponding member switch.

Device Name: Display the description of the member switch.

Member MAC: Displays the MAC address of the member switch.

IP Address: Displays the IP address of the member switch used in the cluster.

Status: Displays the connection status of the member switch.

Role: Displays the role the switch plays currently.

Online Time: Displays the time when the member switch is added to the cluster.

Hops: Displays the hop count from the member switch to the commander switch.

Manage: Click the **Manage** button after selecting the desired entry to log on to the Web management page of the corresponding member switch.

14.3.4 Cluster Topology

On this page you can see the whole cluster topology. Click the node switch to directly log on to the corresponding Web management page for you to configure and manage this switch. Double-click the node switch to view its detailed information.

Choose the menu **Cluster**→**Cluster**→**Cluster Topology** to load the following page.

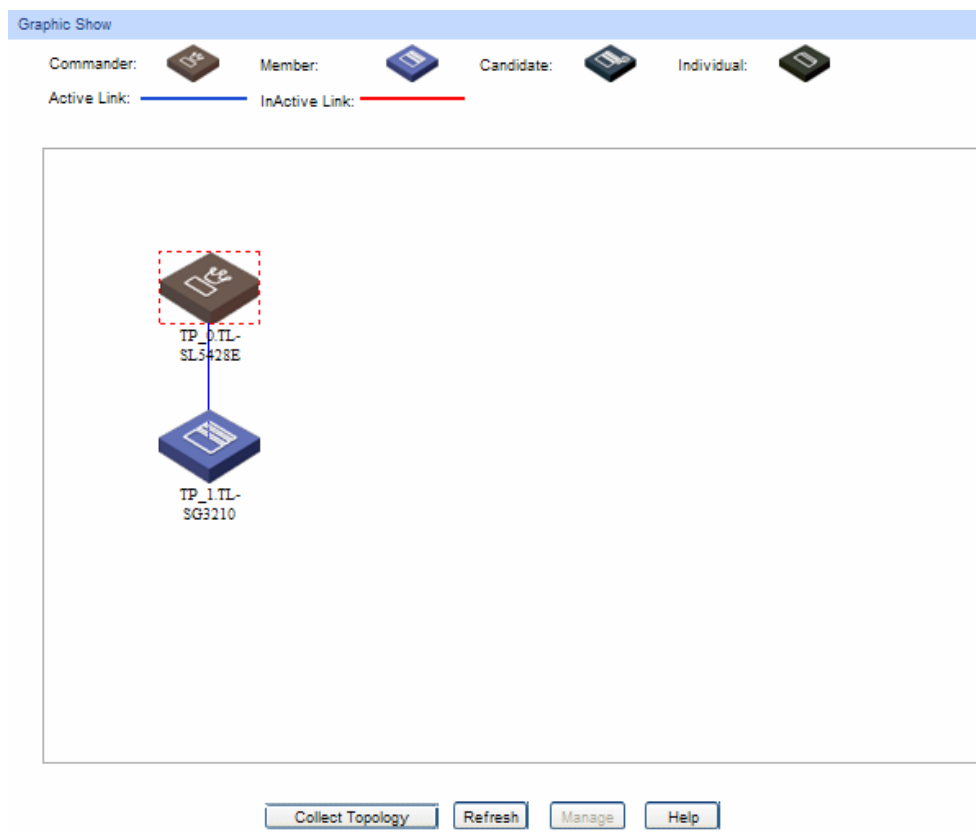

Figure 14-18 Collect Topology

The following entries are displayed on this screen:

➤ **Graphic Show**

Collect Topology:

Click the **Collect Topology** button to display the cluster topology.

Manage:

If the current device is the commander switch in the cluster and the selected device is a member switch in the cluster, you can click the **Manage** button to log on to Web management page of the corresponding switch.

Global configuration procedure of the Cluster function:

Before configuring a cluster, you should make clear the role each device will play in the cluster in advance and make sure the devices in the cluster can communicate with each other.

- If the switch is a commander switch in the cluster, please take the following steps.

Step	Operation	Description
1	Enable the NDP function globally and for the port, and then configure NDP parameters	Optional. On Cluster→NDP→NDP Config page, enable the NDP function on the switch.
2	Enable the NTDP function globally and for the port, and then configure NTDP parameters	Optional. On Cluster→NTDP→NTDP Config page, enable the NTDP function on the switch.
3	Establish a cluster and configure the related parameters	Optional. On Cluster→Cluster→Cluster Config page, establish a cluster and configure the related parameters.
4	Manage the device in the cluster	Optional. On Cluster→Cluster→Member Config page, select the desired member switches and click the Manage button to log on to its Web management page for configuration. Or On Cluster→Cluster→Collect Topology page, double-click the icon of the switch to view its detailed information; click the icon, and then click the Manage button to log on to its Web management page for configuration.

- If the switch is a member switch in the cluster, please take the following steps.

Step	Operation	Description
1	Enable the NDP function globally and for the port, and then configure NDP parameters	Optional. On Cluster→NDP→NDP Config page, enable the NDP function on the switch.
2	Enable the NTDP function globally and for the port, and then configure NTDP parameters	Optional. On Cluster→NTDP→NTDP Config page, enable the NTDP function on the switch.
3	Manually collect NTDP information	Optional. On Cluster→NTDP→Device Table page, click the Collect Topology button to manually collect NTDP information. Or On Cluster→Cluster→Cluster Topology page, click the Collect Topology button to manually collect NTDP information.
4	View the detailed information of other switches in the cluster.	Optional. On Cluster→Cluster→Cluster Topology page, double-click the icon of the switch to view its detailed information.

14.4 Batch Management

The Batch Management function allows you to manage the switches in cluster. With a TFTP server set, you can backup the current settings to the TFTP server, or restore the switches to previous settings.

The Batch Management function is implemented on **Batch Management**, **Status** and **Time-Segment Config** pages.

14.4.1 Batch Management

On this page you can manage the switches in cluster.

Choose the menu **Cluster**→**Batch Management**→**Batch Management** to load the following page.

Select	Index	Role	Device Name	Operation	Filename	Time-Segment Name
<input type="checkbox"/>	0	Commander	TP_0.TL-S L5428E			Select Time-Segment
<input type="checkbox"/>	1	Member	TP_1.TL-S G3210			Select Time-Segment

Note:
1. Please input the path and filename in the "Filename" textbox, before backup and restore.
2. Can not set commander and member at the same time.
3. Please reboot the corresponding switch to bring the restore operation into effect, and do not save config before reboot.
4. Please save config before backup and auto backup.

Figure 14-19 Batch Management

The following entries are displayed on this screen:

➤ **Batch Management**

- Select:** Select the desired switch to configure.
- Index:** Displays the index of the switch.
- Role:** Displays the role the switch plays in the cluster.
- Device Name:** Displays the description of the switch in the cluster.
- Operation:** Select the operation for the switch to act:
- **Backup:** Backup the configuration to TFTP server.
 - **Restore:** Download the configuration file from TFTP server, and then restore the switch with the configuration file.
 - **Auto Backup:** Auto backup the configuration to TFTP server according to the related time-segment. To auto backup the switch, please define a time-segment on **Time-Segment Config** page first.
- Filename:** Specify filename, when the operation is Auto Backup, there is no need to input filename.
- Time-Segment Name:** Select the time-segment for the Auto Backup operation to take effect.

14.4.2 Status

On this page you can view the status of the switches in cluster.

Choose the menu **Cluster**→**Batch Management**→**Status** to load the following page.

Status						
Select	Index	Role	Device Name	Operation	Related Time-Segment	Current Operation Status
<input type="checkbox"/>						
<input type="checkbox"/>	0	Commander	TP_0.TL-S L5428E	----	----	No config
<input type="checkbox"/>	1	Member	TP_1.TL-S G3210	----	----	No config

Note:
It will take several minutes to backup and restore. Please wait without any operation.

Figure 14-20 Status

The following entries are displayed on this screen:

➤ **Status**

- Select:** Select the desired switch and click the **cancel** button to cancel the Auto Backup operation.
- Index:** Displays the index of the switch.
- Role:** Displays the role the switch plays in the cluster.
- Device Name:** Displays the description of the switch in the cluster.
- Operation:** Displays the operation of the switch.
- Related Time-Segment:** Displays the time-segment which is related to the switch.
- Current Operation Status:** Displays the current operation status of the switch.

14.4.3 Time-Segment Config

On this page you can define the time-segment. The Auto Backup function mentioned in [14.4.1 Batch Management](#) is time-segment based, it takes effect only when the specified time-segment is configured and the system time is within the time-segment. In each time-segment, only one Backup Time can be configured, which is the exact time for the switch to auto backup.

Choose the menu **Cluster**→**Batch Management**→**Time-Segment Config** to load the following page.

Create Time-Segment

Name:

Absolute Start Date: 2000 / 01 / 01 End Date: 2000 / 01 / 01
 Week Mon Tue Wed Thu Fri Sat Sun

Backup Time

Backup Time: :

Time-Segment Table

Select	Index	Backup Time	Name	Operation
<input type="checkbox"/>	1	00:00	t1	Detail Edit

Figure 14-21 Create Time-Segment

The following entries are displayed on this screen:

➤ **Create Time-Segment**

Name: Enter the name of the time-segment.

Absolute: Select Absolute and set the Start/End Date to configure absolute time-segment. The Auto Backup operation based on this time-segment takes effect only when the system time is within the absolute time-segment.

Week: Select Week and then select the day(s) in a week to configure week time-segment. The Auto Backup operation based on this time-segment takes effect only when the system time is within the week time-segment.

➤ **Backup Time**

Backup Time: Specify the time for the switch to backup. The switch will backup its configurations only when its system time is right at the backup time.

➤ **Time-Segment Table**

Select: Select the desired entry to delete the corresponding time-segment.

Index: Displays the index of the time-segment.

Backup Time: Displays the backup time of the time-segment.

Name: Displays the name of the time-segment.

Operation: Click Detail to view the information of the time-segment, or click Edit to modify the time-segment.

[Return to CONTENTS](#)

Chapter 15 Maintenance

Maintenance module, assembling the commonly used system tools to manage the switch, provides the convenient method to locate and solve the network problem.

- (1) System Monitor: Monitor the utilization status of the memory and the CPU of switch.
- (2) Log: View the configuration parameters of the switch and find out the errors via the Logs.
- (3) Cable Test: Test the connection status of the cable to locate and diagnose the trouble spot of the network.
- (4) Loopback: Test whether the ports of the switch and its peer device are available.
- (5) Network Diagnostics: Test whether the destination device is reachable and detect the route hops from the switch to the destination device.

15.1 System Monitor

System Monitor functions to display the utilization status of the memory and the CPU of switch via the data graph. The CPU utilization rate and the memory utilization rate should fluctuate stably around a specific value. If the CPU utilization rate or the memory utilization rate increases markedly, please detect whether the network is being attacked.

The **System Monitor** function is implemented on the **CPU Monitor** and **Memory Monitor** pages.

15.1.1 CPU Monitor

Choose the menu **Maintenance**→**System Monitor**→**CPU Monitor** to load the following page.

Figure 15-1 CPU Monitor

Click the **Monitor** button to enable the switch to monitor and display its CPU utilization rate every four seconds.

15.1.2 Memory Monitor

Choose the menu **Maintenance**→**System Monitor**→**Memory Monitor** to load the following page.

Figure 15-2 Memory Monitor

Click the **Monitor** button to enable the switch to monitor and display its Memory utilization rate every four seconds.

15.2 Log

The Log system of switch can record, classify and manage the system information effectively, providing powerful support for network administrator to monitor network operation and diagnose malfunction.

The Logs of switch are classified into the following eight levels.

Severity	Level	Description
emergencies	0	The system is unusable.
alerts	1	Action must be taken immediately.
critical	2	Critical conditions
errors	3	Error conditions
warnings	4	Warnings conditions
notifications	5	Normal but significant conditions
informational	6	Informational messages
debugging	7	Debug-level messages

Table 15-1 Log Level

The **Log** function is implemented on the **Log Table**, **Local Log**, **Remote Log** and **Backup Log** pages.

15.2.1 Log Table

The switch supports logs output to two directions, namely, log buffer and log file. The information in log buffer will be lost after the switch is rebooted or powered off whereas the information in log file will be kept effective even the switch is rebooted or powered off. Log Table displays the system log information in log buffer.

Choose the menu **Maintenance**→**Log**→**Log Table** to load the following page.

16	2006-01-01 08:00:10	MSTP	level_6	Disable STP on port 14.
17	2006-01-01 08:00:10	MSTP	level_6	Disable STP on port 13.
18	2006-01-01 08:00:10	MSTP	level_6	Disable STP on port 12.

Figure 15-3 Log Table

The following entries are displayed on this screen:

➤ Log Info

- Index:** Displays the index of the log information.
- Time:** Displays the time when the log event occurs. The log can get the correct time after you configure on the System ->System Info->System Time Web management page.
- Module:** Displays the module which the log information belongs to. You can select a module from the drop-down list to display the corresponding log information.
- Severity:** Displays the severity level of the log information. You can select a severity level to display the log information whose severity level value is the same or smaller.
- Content:** Displays the content of the log information.

Note:

1. The logs are classified into eight levels based on severity. The higher the information severity is, the lower the corresponding level is.
2. This page displays logs in the log buffer, and at most 511 logs are displayed.

15.2.2 Local Log

Local Log is the log information saved in switch. By default, all system logs are saved in log buffer and the logs with severities from level_0 to level_2 are saved in log file meanwhile. On this page, you can set the output channel for logs.

Choose the menu **Maintenance**→**Log**→**Local Log** to load the following page.

Local Log Config			
Select	Channel	Severity	Status
<input type="checkbox"/>		<input type="text" value=""/>	<input type="text" value=""/>
<input type="checkbox"/>	Log Buffer	level_6	Enable
<input type="checkbox"/>	Log File	level_2	Enable

Note:

1. Local log includes 2 channels: log buffer and log file.
2. There are 8 severity levels marked with values 0-7. The smaller value has the higher priority.

Figure 15-4 Local Log

The following entries are displayed on this screen:

➤ **Local Log Config**

- Select:** Select the desired entry to configure the corresponding local log.
- Log Buffer:** Indicates the RAM for saving system log. The information in the log buffer is displayed on the Log Table page. It will be lost when the switch is restarted.
- Log File:** Indicates the flash sector for saving system log. The information in the log file will not be lost after the switch is restarted and can be exported on the Backup Log page.
- Severity:** Specify the severity level of the log information output to each channel. Only the log with the same or smaller severity level value will be output.
- Status:** Enable/Disable the channel.

15.2.3 Remote Log

Remote log feature enables the switch to send system logs to the Log Server. Log Server is to centralize the system logs from various devices for the administrator to monitor and manage the whole network.

Choose the menu **Maintenance**→**Log**→**Remote Log** to load the following page.

Log Host					
Select	Index	Host IP	UDP Port	Severity	Status
<input type="checkbox"/>		<input type="text"/>		<input type="text" value="level_6"/>	<input type="text" value="Disable"/>
<input type="checkbox"/>	1	0.0.0.0	514	level_6	Disable
<input type="checkbox"/>	2	0.0.0.0	514	level_6	Disable
<input type="checkbox"/>	3	0.0.0.0	514	level_6	Disable
<input type="checkbox"/>	4	0.0.0.0	514	level_6	Disable

Note:

- 1.Up to 4 log hosts are supported.
- 2.There are 8 severity levels marked with values 0-7. The smaller value has the higher priority.

Figure 15-5 Log Host

The following entries are displayed on this screen:

➤ **Log Host**

- Index:** Displays the index of the log host. The switch supports 4 log hosts.
- Host IP:** Configure the IP for the log host.
- UDP Port:** Displays the UDP port used for receiving/sending log information. Here we use the standard port 514.
- Severity:** Specify the severity level of the log information sent to each log host. Only the log with the same or smaller severity level value will be sent to the corresponding log host.
- Status:** Enable/Disable the log host.

Note:

The Log Server software is not provided. If necessary, please download it on the Internet.

15.2.4 Backup Log

Backup Log feature enables the system logs saved in the switch to be output as a file for device diagnosis and statistics analysis. When a critical error results in the breakdown of the system, you can export the logs to get some related important information about the error for device diagnosis after the switch is restarted.

Choose the menu **Maintenance**→**Log**→**Backup Log** to load the following page.

Backup Log	
Click the button here to backup the log file:	
<input type="button" value="Backup Log"/>	<input type="button" value="Help"/>

Note:

It will take a few minutes to backup the log file. Please wait without any operation.

Figure 15-6 Backup Log

The following entry is displayed on this screen:

➤ **Backup Log**

Backup Log: Click the **Backup Log** button to save the log as a file to your computer.

Note:

It will take a few minutes to backup the log file. Please wait without any operation.

15.3 Device Diagnostics

This switch provides Cable Test and Loopback functions for device diagnostics.

15.3.1 Cable Test

Cable Test functions to test the connection status of the cable connected to the switch, which facilitates you to locate and diagnose the trouble spot of the network.

Choose the menu **Maintenance**→**Device Diagnostics**→**Cable Test** to load the following page.

Cable Test			
Port: --			Unit: meter
Pair	Status	Length	Error
Pair-A	--	--	--
Pair-B	--	--	--
Pair-C	--	--	--
Pair-D	--	--	--

Note:

1. The interval between two cable test for one port must be more than 3 seconds.
2. The result is more reasonable when the cable pair is in the open status.
3. The result is just for your information.
4. If the port is 100M and its connection status is normal, cable test can't get the length of the cable.

Figure 15-7 Cable Test

The following entries are displayed on this screen:

➤ **Cable Test**

- Port:** Select the port for cable testing.
- Pair:** Displays the Pair number.
- Status:** Displays the connection status of the cable connected to the port. The test results of the cable include normal, close, open or impedance.
- Length:** If the connection status is normal, here displays the length range of the cable.
- Error:** If the connection status is close, open or impedance, here displays the error length of the cable.

Note:

1. The interval between two cable tests for one port must be more than 3 seconds.
2. The result is more reasonable when the cable pair is in the open status.
3. The test result is just for your reference.

- If the port is 100Mbps and its connection status is normal, cable test can't get the length of the cable.

15.3.2 Loopback

Loopback test function, looping the sender and the receiver of the signal, is used to test whether the port of the switch is available as well as to check and analyze the physical connection status of the port to help you locate and solve network malfunctions.

Choose the menu **Maintenance**→**Device Diagnostics**→**Loopback** to load the following page.

Loopback Type

Loopback Type: Internal External

Loopback Port

<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4	<input type="checkbox"/> 5	<input type="checkbox"/> 6
<input type="checkbox"/> 7	<input type="checkbox"/> 8	<input type="checkbox"/> 9	<input type="checkbox"/> 10	<input type="checkbox"/> 11	<input type="checkbox"/> 12
<input type="checkbox"/> 13	<input type="checkbox"/> 14	<input type="checkbox"/> 15	<input type="checkbox"/> 16	<input type="checkbox"/> 17	<input type="checkbox"/> 18
<input type="checkbox"/> 19	<input type="checkbox"/> 20	<input type="checkbox"/> 21	<input type="checkbox"/> 22	<input type="checkbox"/> 23	<input type="checkbox"/> 24
<input type="checkbox"/> 25	<input type="checkbox"/> 26	<input type="checkbox"/> 27	<input type="checkbox"/> 28		

Loopback Result

Port:N/A
Type:N/A
Result:N/A

Figure 15-8 Loopback

The following entries are displayed on this screen:

➤ **Loopback Type**

Internal: Select Internal to test whether the port is available.

External: Select External to test whether the device connected to the port of the switch is available

➤ **Loopback Port**

Loopback Port: Select the desired port for loopback test.

Test: Click the **Test** button to start the loopback test for the port.

➤ **Loopback Result**

Here you can view the loop back result.

15.4 Network Diagnostics

This switch provides Ping test and Tracert test functions for network diagnostics.

15.4.1 Ping

Ping test function, testing the connectivity between the switch and one node of the network, facilitates you to test the network connectivity and reachability of the host so as to locate the network malfunctions.

Choose the menu **Maintenance**→**Network Diagnostics**→**Ping** to load the following page.

Ping Config	
Destination IP:	<input type="text" value="192.168.0.1"/>
Ping Times:	<input type="text" value="4"/> (1-10)
Data Size:	<input type="text" value="64"/> byte (1-1024)
Interval:	<input type="text" value="1000"/> millisec (100-1000)

Ping Result	
Pinging 192.168.0.1 with 64 bytes of data :	
Reply from 192.168.0.1 :	bytes=64 time<16ms TTL=64
Reply from 192.168.0.1 :	bytes=64 time<16ms TTL=64
Reply from 192.168.0.1 :	bytes=64 time<16ms TTL=64
Reply from 192.168.0.1 :	bytes=64 time<16ms TTL=64
Ping statistics for 192.168.0.1:	
Packets: Sent = 4 , Received = 4 , Lost = 0 (0% loss)	
Approximate round trip times in milli-seconds:	
Minimum = 0ms , Maximum = 0ms , Average = 0ms	

Figure 15-9 Ping

The following entries are displayed on this screen:

➤ **Ping Config**

- Destination IP:** Enter the IP address of the destination node for Ping test.
- Ping Times:** Enter the amount of times to send test data during Ping testing. The default value is recommended.
- Data Size:** Enter the size of the sending data during Ping testing. The default value is recommended.
- Interval:** Specify the interval to send ICMP request packets. The default value is recommended.

➤ **Ping Result**

Here you can view the Ping result.

15.4.2 Tracert

Tracert test function is used to test the connectivity of the gateways during its journey from the source to destination of the test data. When malfunctions occur to the network, you can locate trouble spot of the network with this tracert test.

Choose the menu **Maintenance**→**Network Diagnostics**→**Tracert** to load the following page.

The screenshot shows a web-based configuration interface for a Tracert test. It is divided into two main sections: 'Tracert Config' and 'Tracert Result'. The 'Tracert Config' section contains three input fields: 'Destination IP' with the value '192.168.0.100', 'Max Hop' with the value '4' and a unit label 'hop (1-30)', and 'Wait Time' with the value '1000' and a unit label 'ms(1-10000)'. To the right of these fields are two buttons: 'Tracert' and 'Help'. The 'Tracert Result' section is currently empty.

Figure 15-10 Tracert

The following entries are displayed on this screen:

➤ **Tracert Config**

Destination IP: Enter the IP address of the destination device.

Max Hop: Specify the maximum number of the route hops the test data can pass through.

Wait Time: Enter the maximum time (in milliseconds) for the test data to wait before timeout.

➤ **Tracert Result**

Here you can view the Tracert result.

Chapter 16 System Maintenance via FTP

The firmware can be downloaded to the switch via FTP function. FTP (File Transfer Protocol), a protocol in the application layer, is mainly used to transfer files between the remote server and the local PCs. It is a common protocol used in the IP network for files transfer. If there is something wrong with the firmware of the switch and the switch can not be launched, the firmware can be downloaded to the switch again via FTP function.

1. Hardware Installation

Figure 16-1 Hardware Installation

- 1) Connect FTP server to port 1 of the switch.
- 2) Connect the Console port of the PC to the switch.
- 3) Save the firmware of the switch in the shared file of FTP server. Please write down the user name, password and the firmware name.

2. Configure the Hyper Terminal

After the hardware installation, please take the following steps to configure the hyper terminal of the management PC to manage the switch.

- 1) Select **Start**→**All Programs**→**Accessories**→**Communications**→**Hyper Terminal** to open hyper terminal.

Figure 16-2 Open Hyper Terminal

- 2) The Connection Description Window will prompt shown as Figure 16-3. Enter a name into the Name field and click **OK**.

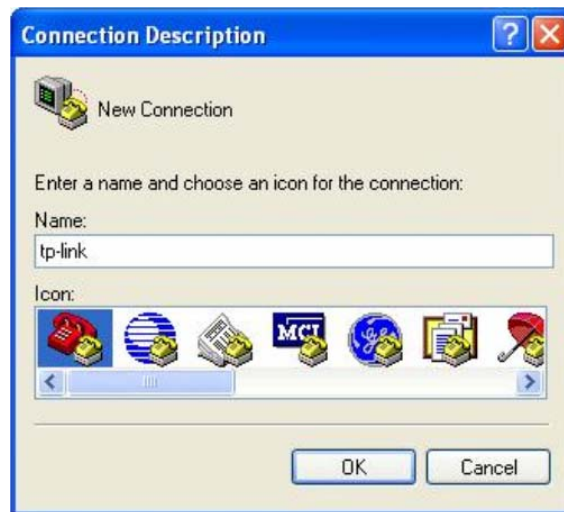

Figure 16-3 Connection Description

- 3) Select the port to connect in Figure 16-4 and click **OK**.

Figure 16-4 Select the port to connect

- 4) Configure the port selected in the step above shown as the following Figure 16-5. Configure **Bits per second** as 38400, **Data bits** as 8, **Parity** as None, **Stop bits** as 1, **Flow control** as None, and then click **OK**.

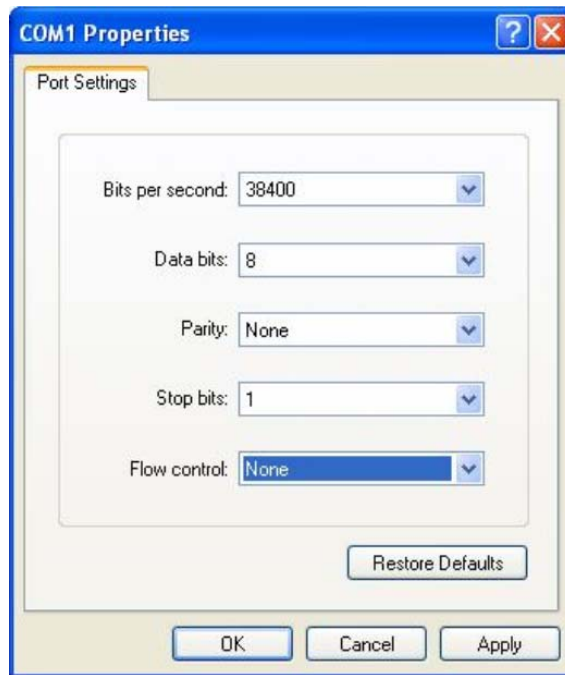

Figure 16-5 Port Settings

3. Download Firmware via bootrom menu

To download firmware to the switch via FTP function, you need to enter into the bootrom menu of the switch and take the following steps.

- 1) Connect the console port of the PC to the console port of the switch and open hyper terminal. Connect FTP server to port 1 of the switch.
- 2) Power off and restart the switch. When you are prompted that “Press CTRL-B to enter the bootrom” in the hyper terminal, please press CTRL-B key to enter into bootrom menu shown as Figure 16-6.

```

Press CTRL-B to enter the bootrom
*
*          TP-LINK  BOOTROM          *
*          *          *          *
*****

Create Date: Apr  6 2012 17:32:45

help          - print this list
reboot        - reboot the system
ifconfig      - config the interface
ftp           - config the remote host ip,the user name,password and
the image file name
upgrade       - upgrade the firmware
start         - start the system
reset         - reset the system to the factory config.
  
```

Figure 16-6 bootrom Menu

As the prompt is displayed for a short time, you are suggested not to release the CTRL-B key until you enter into bootrom menu after powering on the switch.

- 3) After entering into bootrom menu, please firstly configure the IP parameters of the switch. The format is:

ifconfig ip xxx.xxx.xxx.xxx mask 255.255.255.0 gateway xxx.xxx.xxx.xxx.

For example: Configure the IP address as 10.10.70.22, mask as 255.255.255.0 and gateway as 10.10.70.1. The detailed command is shown as the figure below. Enter the command and press **Enter**.

```
[TL-SL5428E]: ifconfig ip 10.10.70.22 mask 255.255.255.0 gateway 10.10.70.1
```

- 4) Configure the parameters of the FTP server which keeps the upgrade firmware. Later you can download the firmware to the switch from the FTP server. The format of the command is: **ftp host xxx.xxx.xxx.xxx user xxxxx pwd xxxxx file xxxxxx.bin.**

Here take the following parameters of the FTP server as an example. IP address is 10.10.70.146; the user name and password for login to the FTP server are both 123; the name of the upgrade firmware is tl_sl5428e_up.bin. The detailed command is shown as the following figure. Enter the command and press **Enter**.

```
[TL-SL5428E]: ftp host 10.10.70.146 user 123 pwd 123 file tl_sl5428e_up.bin
```

- 5) Enter the upgrade command and press **Enter** to upgrade the firmware. After a while, the prompt "You can only use the port 1 to upgrade" will display in the hyper terminal shown as the following figure.

```
[TL-SL5428E]: upgrade
```

```
You can only use the port 1 to upgrade.
```

- 6) When the prompt "Are you sure to upgrade the firmware[Y/N]:" displays, please enter **Y** to start upgrade or enter **N** to quit upgrade shown as the following figure. The # icon indicates it is upgrading. After upgrading, the [TL-SL5428E] command will display.

```
Are you sure to upgrade the firmware[Y/N]: y
```

```
#####  
#####  
#####  
#####
```

```
[TL-SL5428E]:
```

- 7) Please enter start command to start the switch shown as the following figure. Enter the user name and password (the default user name and password are both admin) to login to the CLI command window and you can manage the switch via CLI command.

```
[TL-SL5428E]: start
```

```
Start . . . . .
```

```
◀
```

```
***** User Access Login *****
```

```
User:
```

When you forget the login user name and password, you can enter reset command after entering into bootrom menu to reset the system. The system will be restored to the factory default settings, and the default login user name and password are both admin.

Appendix B: Configuring the PCs

In this section, we'll introduce how to install and configure the TCP/IP correctly in Windows 2000. First make sure your Ethernet Adapter is working, refer to the adapter's manual if necessary.

1. Configure TCP/IP component

- 1) On the Windows taskbar, click the **Start** button, and then click **Control Panel**.
- 2) Click the **Network and Internet Connections** icon, and then click on the **Network Connections** tab in the appearing window.
- 3) Right click the icon that showed below, select Properties on the prompt page.

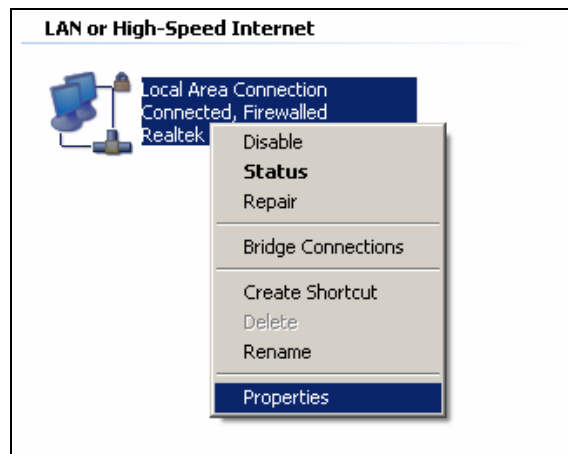

Figure B-1

- 4) In the prompt page that showed below, double click on the **Internet Protocol (TCP/IP)**.

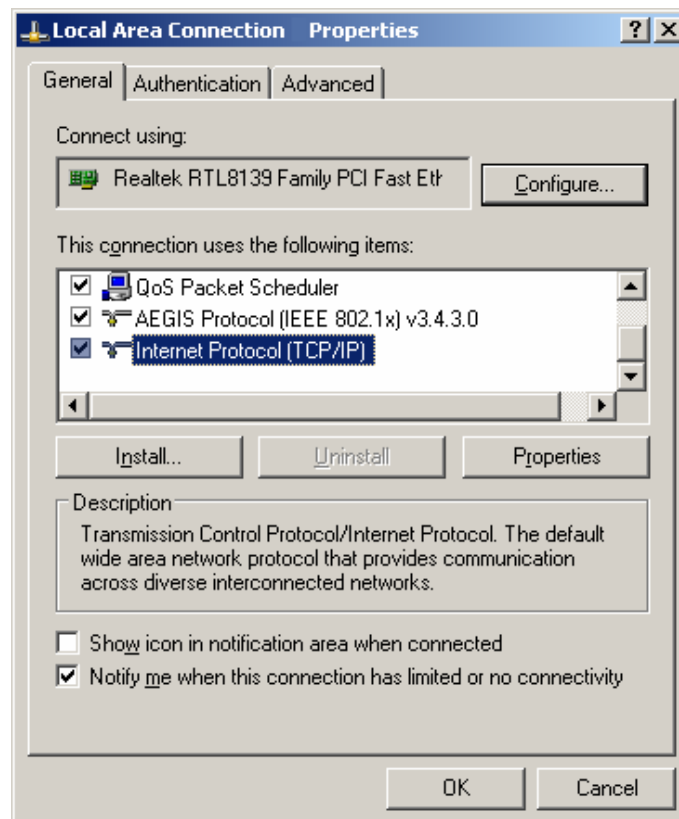

Figure B-2

- 5) The following **TCP/IP Properties** window will display and the **IP Address** tab is open on this window by default.

Figure B-3

- 6) Select **Use the following IP address**. And the following items will be available. If the switch's IP address is 192.168.0.1, specify IP address as 192.168.0.x (x is from 2 to 254), and the **Subnet mask** as 255.255.255.0.

Now:

Click **OK** to save your settings.

Appendix C: 802.1X Client Software

In 802.1X mechanism, the supplicant Client should be equipped with the corresponding client software complied with 802.1X protocol standard for 802.1X authentication. When the switch TL-SG3216 works as the authenticator system, please take the following instructions to install the TpSupplicant provided on the attached CD for the supplicant Client.

1.1 Installation Guide

1. Insert the provided CD into your CD-ROM drive. Open the file folder and double click the icon  to load the following figure. Choose the proper language and click **Next** to continue.

Figure C-1 Choose Setup Language

2. Please wait for the InstallShield Wizard preparing the setup shown as the following screen.

Figure C-2 Preparing Setup

3. Then the following screen will appear. Click **Next** to continue. If you want to stop the installation, click **Cancel**.

Figure C-3 Welcome to the InstallShield Wizard

4. To continue, choose the destination location for the installation files and click **Next** on the following screen.

Figure C-4 Choose Destination Location

By default, the installation files are saved on the Program Files folder of system disk. Click the **Change** button to modify the destination location proper to your need.

5. Till now, The Wizard is ready to begin the installation. Click **Install** to start the installation on the following screen.

Figure C-5 Install the Program

6. The InstallShield Wizard is installing TpSupplicant shown as the following screen. Please wait.

Figure C-6 Setup Status

7. On the following screen, click **Finish** to complete the installation.

Figure C-7 InstallShield Wizard Complete

Note: Please pay attention to the tips on the above screen. If you have not installed WinPcap 4.0.2 or the higher version on your computer, the 802.1X Client Software TpSupplicant can not work. It's recommended to go to <http://www.winpcap.org> to download the latest version of WinPcap for installation.

1.2 Uninstall Software

If you want to remove the TpSupplicant, please take the following steps:

1. On the Windows taskbar, click the **Start** button, point to **All Programs**→**TP-LINK**→**TpSupplicant**, and then click **Uninstall TP-LINK 802.1X**, shown as the following figure.

Figure C-8 Uninstall TP-LINK 802.1X

2. Then the following screen will appear. If you want to stop the remove process, click **Cancel**.

Figure C-9 Preparing Setup

3. On the continued screen, click **Yes** to remove the application from your PC.

Figure C-10 Uninstall the Application

4. Click **Finish** to complete.

Figure C-11 Uninstall Complete

1.3 Configuration

1. After completing installation, double click the icon  to run the TP-LINK 802.1X Client Software. The following screen will appear.

Figure C-12 TP-LINK 802.1X Client

Enter the **Name** and the **Password** specified in the Authentication Server. The length of **Name** and **Password** should be less than 16 characters.

2. Click the **Properties** button on Figure C-12 to load the following screen for configuring the connection properties.

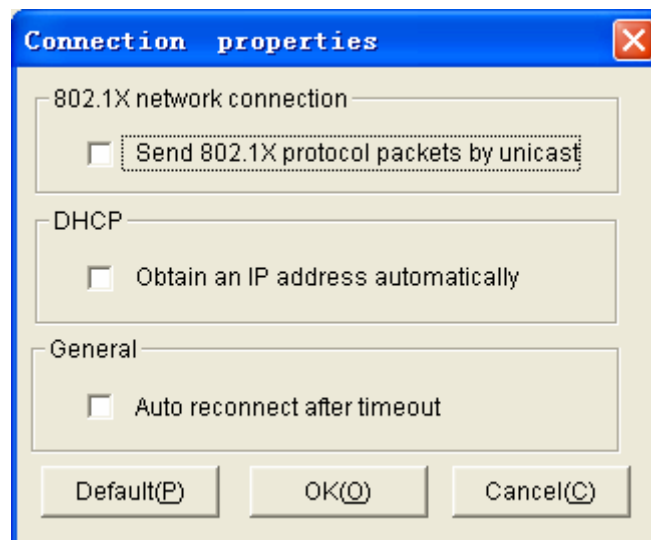

Figure C-13 Connection Properties

Send 802.1X protocol packets by Unicast: When this option is selected, the Client will send the EAPOL Start packets to the switch via multicast and send the 802.1X authentication packets via unicast.

Obtain an IP address automatically: Select this option if the Client automatically obtains the IP address from DHCP server. After passing the authentication, the Client can be assigned the IP address by DHCP server. The Client can access the network after getting the new IP address.

Auto reconnect after timeout: Select this option to allow the Client to automatically start the connection again when it does not receive the handshake reply packets from the switch within a period.

- To continue, click **Connect** button after entering the **Name** and **Password** on Figure C-12. Then the following screen will appear to prompt that the Radius server is being searched.

Figure C-14 Authentication Dialog

- When passing the authentication, the following screen will appear.

Figure C-15 Successfully Authenticated

- Double click the icon  on the right corner of desktop, and then the following connection status screen will pop up.

Figure C-16 Connection Status

1.4 FAQ:

Q1: Why does this error dialog box pop up when starting up the TP-LINK 802.1X Client Software?

A1: It's because the supported DLL file is missing. You are suggested to go to <http://www.winpcap.org> to download WinPcap 4.0.2 or the higher version for installation, and run the client software again.

Q2: Is this TP-LINK 802.1X Client Software compliable with the switches of the other manufacturers?

A2: No. This TP-LINK 802.1X Client Software is customized for TP-LINK switches.

Q3: Is it safe to set the password being automatically saved?

A3: Yes. The password saved in the configuration files is encrypted.

[Return to CONTENTS](#)

Appendix D: Glossary

Access Control List (ACL)

ACLs can limit network traffic and restrict access to certain users or devices by checking each packet for certain IP or MAC (i.e., Layer 2) information.

Boot Protocol (BOOTP)

BOOTP is used to provide bootup information for network devices, including IP address information, the address of the TFTP server that contains the devices system files, and the name of the boot file.

Class of Service (CoS)

CoS is supported by prioritizing packets based on the required level of service, and then placing them in the appropriate output queue. Data is transmitted from the queues using weighted round-robin service to enforce priority service and prevent blockage of lower-level queues. Priority may be set according to the port default, the packet's priority bit (in the VLAN tag), TCP/UDP port number, or DSCP priority bit.

Differentiated Services Code Point (DSCP)

DSCP uses a six-bit tag to provide for up to 64 different forwarding behaviors. Based on network policies, different kinds of traffic can be marked for different kinds of forwarding. The DSCP bits are mapped to the Class of Service categories, and then into the output queues.

Domain Name Service (DNS)

A system used for translating host names for network nodes into IP addresses.

Dynamic Host Control Protocol (DHCP)

Provides a framework for passing configuration information to hosts on a TCP/IP network. DHCP is based on the Bootstrap Protocol (BOOTP), adding the capability of automatic allocation of reusable network addresses and additional configuration options.

Extensible Authentication Protocol over LAN (EAPOL)

EAPOL is a client authentication protocol used by this switch to verify the network access rights for any device that is plugged into the switch. A user name and password is requested by the switch, and then passed to an authentication server (e.g., RADIUS) for verification. EAPOL is implemented as part of the IEEE 802.1X Port Authentication standard.

GARP VLAN Registration Protocol (GVRP)

Defines a way for switches to exchange VLAN information in order to register necessary VLAN members on ports along the Spanning Tree so that VLANs defined in each switch can work automatically over a Spanning Tree network.

Generic Attribute Registration Protocol (GARP)

The GARP provides a generic attribute dissemination capability that is used by participants in GARP Applications (GARP Participants) to register and de-register attribute values with other GARP Participants within a Bridged LAN. The definition of the attribute types, the values that they can carry, and the semantics that are associated with those values when registered, are specific to the operation of the GARP Application concerned.

Generic Multicast Registration Protocol (GMRP)

GMRP allows network devices to register end stations with multicast groups. GMRP requires that any participating network devices or end stations comply with the IEEE 802.1p standard.

Group Attribute Registration Protocol (GARP)

See Generic Attribute Registration Protocol.

IEEE 802.1D

Specifies a general method for the operation of MAC bridges, including the Spanning Tree Protocol.

IEEE 802.1Q

VLAN Tagging—Defines Ethernet frame tags which carry VLAN information. It allows switches to assign endstations to different virtual LANs, and defines a standard way for VLANs to communicate across switched networks.

IEEE 802.1p

An IEEE standard for providing quality of service (QoS) in Ethernet networks. The standard uses packet tags that define up to eight traffic classes and allows switches to transmit packets based on the tagged priority value.

IEEE 802.1X

Port Authentication controls access to the switch ports by requiring users to first enter a user ID and password for authentication.

IEEE 802.3ac

Defines frame extensions for VLAN tagging.

IEEE 802.3x

Defines Ethernet frame start/stop requests and timers used for flow control on full-duplex links. (Now incorporated in IEEE 802.3-2002)

Internet Group Management Protocol (IGMP)

A protocol through which hosts can register with their local router for multicast services. If there is more than one multicast switch/router on a given subnetwork, one of the devices acts as the “querier” and assumes responsibility for keeping track of group membership.

IGMP Snooping

Listening to IGMP Query and IGMP Report packets transferred between IP Multicast Routers and IP Multicast host groups to identify IP Multicast group members.

IGMP Query

On each subnetwork, one IGMP-capable device will act as the querier — that is, the device that asks all hosts to report on the IP multicast groups they wish to join or to which they already belong. The elected querier will be the device with the lowest IP address in the subnetwork.

IP Multicast Filtering

It is a feature to allow or deny the Client to add the specified multicast group.

Multicast Switching

A process whereby the switch filters incoming multicast frames for services for which no attached host has registered, or forwards them to all ports contained within the designated multicast group.

Layer 2

Data Link layer in the ISO 7-Layer Data Communications Protocol. This is related directly to the hardware interface for network devices and passes on traffic based on MAC addresses.

Link Aggregation

See Port Trunk.

Link Aggregation Control Protocol (LACP)

Allows ports to automatically negotiate a trunked link with LACP-configured ports on another device.

Management Information Base (MIB)

An acronym for Management Information Base. It is a set of database objects that contains information about a specific device.

MD5 Message-Digest Algorithm

An algorithm that is used to create digital signatures. It is intended for use with 32 bit machines and is safer than the MD4 algorithm, which has been broken. MD5 is a one-way hash function, meaning that it takes a message and converts it into a fixed string of digits, also called a message digest.

Network Time Protocol (NTP)

NTP provides the mechanisms to synchronize time across the network. The time servers operate in a hierarchical-master-slave configuration in order to synchronize local clocks within the subnet and to national time standards via wire or radio.

Port Authentication

See IEEE 802.1X.

Port Mirroring

A method whereby data on a target port is mirrored to a monitor port for troubleshooting with a logic analyzer or RMON probe. This allows data on the target port to be studied unobstructively.

Port Trunk

Defines a network link aggregation and trunking method which specifies how to create a single high-speed logical link that combines several lower-speed physical links.

Remote Authentication Dial-in User Service (RADIUS)

RADIUS is a logon authentication protocol that uses software running on a central server to control access to RADIUS-compliant devices on the network.

Remote Monitoring (RMON)

RMON provides comprehensive network monitoring capabilities. It eliminates the polling required in standard SNMP, and can set alarms on a variety of traffic conditions, including specific error types.

Rapid Spanning Tree Protocol (RSTP)

RSTP reduces the convergence time for network topology changes to about 10% of that required by the older IEEE 802.1D STP standard.

Secure Shell (SSH)

A secure replacement for remote access functions, including Telnet. SSH can authenticate users with a cryptographic key, and encrypt data connections between management clients and the switch.

Simple Network Management Protocol (SNMP)

The application protocol in the Internet suite of protocols which offers network management services.

Simple Network Time Protocol (SNTP)

SNTP allows a device to set its internal clock based on periodic updates from a Network Time Protocol (NTP) server. Updates can be requested from a specific NTP server, or can be received via broadcasts sent by NTP servers.

Spanning Tree Algorithm (STA)

A technology that checks your network for any loops. A loop can often occur in complicated or backup linked network systems. Spanning Tree detects and directs data along the shortest available path, maximizing the performance and efficiency of the network.

Telnet

Defines a remote communication facility for interfacing to a terminal device over TCP/IP.

Transmission Control Protocol/Internet Protocol (TCP/IP)

Protocol suite that includes TCP as the primary transport protocol, and IP as the network layer protocol.

Trivial File Transfer Protocol (TFTP)

A TCP/IP protocol commonly used for software downloads.

User Datagram Protocol (UDP)

UDP provides a datagram mode for packet-switched communications. It uses IP as the underlying transport mechanism to provide access to IP-like services. UDP packets are delivered just like IP packets – connection-less datagrams that may be discarded before reaching their targets. UDP is useful when TCP would be too complex, too slow, or just unnecessary.

Virtual LAN (VLAN)

A Virtual LAN is a collection of network nodes that share the same collision domain regardless of their physical location or connection point in the network. A VLAN serves as a logical workgroup with no physical barriers, and allows users to share information and resources as though located on the same LAN.
