CE Mark Warning

This is a class B product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

OPERATING FREQUENCY(the maximum transmitted power)

2400MHz-2483.5MHz(20dBm)

LTE Band 1,3,7,8,20,38,40(Power Class 3)

GSM Band900(Power Class 4)

GSM Band1800(Power Class 1)

WCDMA Band1(Power Class 4)

WCDMA Band8(Power Class 3)

EU declaration of conformity

TP-Link hereby declares that the device is in compliance with the essential requirements and other relevant provisions of directives 2014/53/EU, 2009/125/EC and 2011/65/EU.

The original EU declaration of conformity may be found at <http://www.tp-link.com/en/ce>

RF Exposure Information

This device meets the EU requirements (2014/53/EU Article 3.1a) on the limitation of exposure of the general public to electromagnetic fields by way of health protection.

The device complies with RF specifications when the device used at 20 cm from your body.

Продукт сертифіковано згідно с правилами системи УкрСЕПРО на відповідність вимогам нормативних документів та вимогам, що передбачені чинними законодавчими актами України.

Safety Information

- Keep the device away from water, fire, humidity or hot environments.
- Do not attempt to disassemble, repair, or modify the device.
- Do not use damaged charger or USB cable to charge the device.

- Do not use any other chargers than those recommended.
- Do not use the device where wireless devices are not allowed.
- Adapter shall be installed near the equipment and shall be easily accessible.
-  Use only power supplies which are provided by manufacturer and in the original packing of this product. If you have any questions, please don't hesitate to contact us.

Please read and follow the above safety information when operating the device. We cannot guarantee that no accidents or damage will occur due to improper use of the device. Please use this product with care and operate at your own risk.

Explanation of the symbols on the product label

Symbol	Explanation
	DC voltage
	Indoor use only
	<p>RECYCLING</p> <p>This product bears the selective sorting symbol for Waste electrical and electronic equipment (WEEE). This means that this product must be handled pursuant to European directive 2012/19/EU in order to be recycled or dismantled to minimize its impact on the environment.</p> <p>User has the choice to give his product to a competent recycling organization or to the retailer when he buys a new electrical or electronic equipment.</p>

About This Guide

This guide is a complement to Quick Installation Guide. The Quick Installation Guide instructs you on quick internet setup, and this guide provides details of each function and shows you the way to configure these functions appropriate to your needs.

When using this guide, please notice that features of the router may vary slightly depending on the model and software version you have, and on your location, language, and internet service provider. All screenshots, images, parameters and descriptions documented in this guide are used for demonstration only.

Conventions

In this guide, the following conventions are used:

Convention	Description
<u>Teal Underlined</u>	Hyperlinks are in blue with an underline. You can click to redirect to a website or a specific section.
Teal	Contents to be emphasized and texts on the web page are in teal, including the menus, items, buttons, etc.
→	The menu structures to show the path to load the corresponding page. For example, Network → WAN Settings means the WAN settings configuration page is under the Network menu.
 Note	Ignoring this type of note might result in a malfunction or damage to the device.

More Info

The latest software, management app and utility can be found at the Download Center page at <http://www.tp-link.com/support>.

The Quick Installation Guide can be found where you find this guide or inside the package of the modem router.

Specifications can be found on the product page at <http://www.tp-link.com>.

A Technical Support Forum is provided for you to discuss our products at <http://forum.tp-link.com>.

Our Technical Support contact information can be found at Contact Technical Support page at <http://www.tp-link.com/support>.

Chapter 1. Introduction

1.1 Product Overview

TP-Link's Wireless N 4G LTE router shares the latest generation 4G LTE network with multiple Wi-Fi devices anywhere you want.

With Ethernet ports and antennas, the router provides wired and wireless access for multiple computers and mobile devices.

With various features and functions, the router is the perfect hub of your home or business network.

1.2 Product Appearance

1.2.1 LEDs

The router's LEDs are located on the front panel (View from left to right). They indicate the device's working status. For details, please refer to LED Explanation.

Name	Status	Indication
 (Power)	On	The system has started up successfully.
	Flashing	The system is starting up or firmware is being upgraded. Do not disconnect or power off your modem router.
	Off	Power is off.
 (Internet)	On	The router is connected to the internet.
	Off	There is no internet connection.
4G (4G)	On	The router is connected to the 4G network.
	Off	The router is disconnected from the 4G network.

 (Wireless)	On	The wireless function is enabled.
	Off	The wireless function is disabled.
 (LAN)	On	At least one LAN port is connected to a powered-on device.
	Off	No LAN port is connected to a powered-on device.
 (WPS)	On/Off	This light remains on for 5 minutes when a WPS connection is established, then turns off.
	Flashing	WPS connection is in progress. This may take up to 2 minutes.
 (Signal Strength)	On	Indicates the signal strength received from the mobile internet network. More lit bars indicate a better signal strength.
	Off	There is no mobile internet signal.

1.2.2 Ports and Buttons

The following parts are located on the rear panel (View from left to right).

Status	Indication
POWER	The power socket is where you will connect the power adapter. Please use the power adapter provided.
POWER ON/OFF	The switch for the power.
LAN (1, 2, 3)	These ports (1, 2, 3) connect the router to the local PC(s).
LAN4/WAN	This port can be LAN or WAN port depending on the working mode.
WPS/RESET	The switch for the WPS function or resetting the modem router. Refer to the note below for more information.
WiFi ON/OFF	This switch is used to enable/disable the router's wireless function.
SIM Card	Insert the SIM card into the slot.

 Note:

The WPS/RESET button is used for both WPS and RESET function.

(1) Used as RESET button

With the router powered on, press and hold the **WPS/RESET** button on the rear panel of the router until the Power LED starts flashing. Wait while the router will restore and reboot automatically.

(2) Used as WPS button

If you have client devices, such as wireless adapters, that support Wi-Fi Protected Setup, then you can press this button to quickly establish a connection between the router and client devices and automatically configure wireless security for your wireless network. For details, refer to [4.3 WPS](#).

Chapter 2. Connecting the router

2.1 System Requirements

- SIM card with internet access enabled
- PCs with a working Ethernet Adapter and an Ethernet cable with RJ45 connectors
- TCP/IP protocol on each PC
- Web browser, such as Microsoft Internet Explorer, Mozilla Firefox or Apple Safari

2.2 Positioning the Router

- Place the router in a well-ventilated place far from any heater or heating vent
- Avoid direct irradiation of any strong light (such as sunlight)
- Keep at least 2 inches (5 cm) of clear space around the router
- Operating Temperature: 0°C~40°C (32°F~104°F)
- Operating Humidity: 10%~90%RH, Non-condensing

2.3 Connecting the Router

The router supports two modes, [3G/4G router mode](#) and [Standard Wireless Router mode](#). You can deploy the mode appropriate to your actual network environment. To connect the router, please take the following steps for different modes.

a. 3G/4G Router Mode

In 3G/4G router mode, with a 3G/4G SIM card, this router can join a 3G/4G network as well as act as a wireless central hub to broadcast its SSID. Thus, the other wireless devices can connect to the router so as to join the same 3G/4G network.

1. Install the 4G LTE antennas and position them upwards.
2. Insert the SIM card into the slot until you hear a click.

 **Note:**

A micro or nano SIM card must be converted using the SIM card adapter provided.

3. Connect the power adapter to the router and push in to turn on the router.
4. Verify the hardware connection by checking the following LEDs' status. If the Internet LED

 is on, your router is connected to the internet successfully.

 **Note:**

For better internet connection, make sure 3 or 4 bars of the Signal Strength LED  are lit. Otherwise, try relocating the router to a location that may receive a stronger mobile internet signal, such as near a window.

b. Standard Wireless Router Mode

Before installing the router, make sure your PC is connected to the internet through the broadband service successfully. If there is any problem, please contact your ISP. After that, please install the router according to the following steps. Don't forget to pull out the power plug and keep your hands dry.

1. Power off your modem (if the modem has a backup battery, remove it too.), and disconnect your existing router if you have one.
2. Connect the **LAN4/WAN** port on your router to the modem's LAN port with an Ethernet cable.
3. Power on the modem and wait for 2 minutes.
4. Make sure the **WiFi ON/OFF** switch is ON. Then plug the provided power adapter into the power jack and the other end to a standard electrical wall socket. Press the **POWER ON/OFF** button to power on the router. (Before you power on the router, please make sure your computer is NOT connected to any other wireless network.)

Chapter 3. Quick Installation Guide

This chapter will show you how to configure the basic functions of your 4G LTE router using [Quick Setup](#) within minutes.

3.1 3G/4G Router Mode

1. Set up the TCP/IP Protocol in "Obtain an IP address automatically" mode on your PC. If you need instructions how to do this, please refer to [Appendix B: Configuring the PC](#).
2. Connect your computer to the router (wired or wireless).

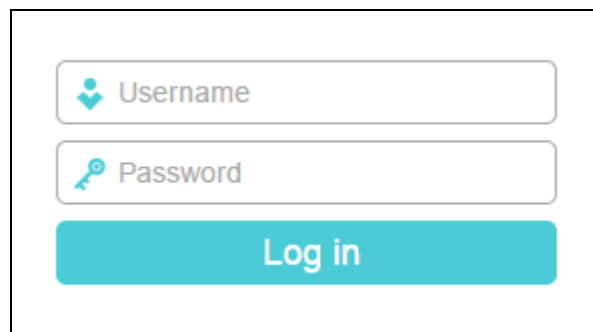

Wired: Connect your computer to the router's LAN port via an Ethernet cable.

Wireless: Connect wirelessly by using the SSID (network name) and Wireless Password printed on the product label at the bottom of the router.

3. To access the configuration utility, open a web browser and type the default address <http://tplinkmodem.net> in the address field of the browser.

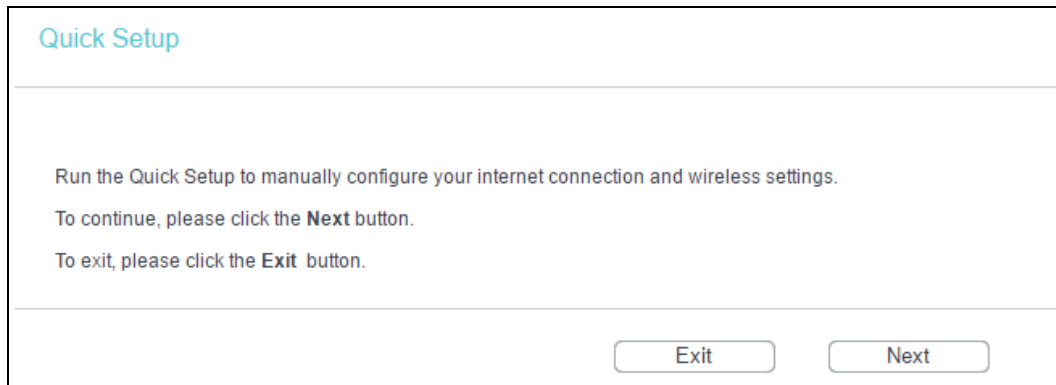

4. After a moment, a login window will appear. Enter **admin** for the Username and Password, both in lower case letters. Then click **Log in** or press the **Enter** key.

A screenshot of a login window. It features two input fields: the top one is labeled 'Username' with a user icon, and the bottom one is labeled 'Password' with a key icon. Below these fields is a prominent teal button labeled 'Log in'.

Note:

If the above screen does not pop-up, it means that your web browser has been set to a proxy. Go to [Tools > Internet Options > Connections > LAN Settings](#), in the screen that appears, cancel the Using Proxy checkbox, and click OK to finish it.

5. Go to [Quick Setup](#) and click [Next](#).

Quick Setup

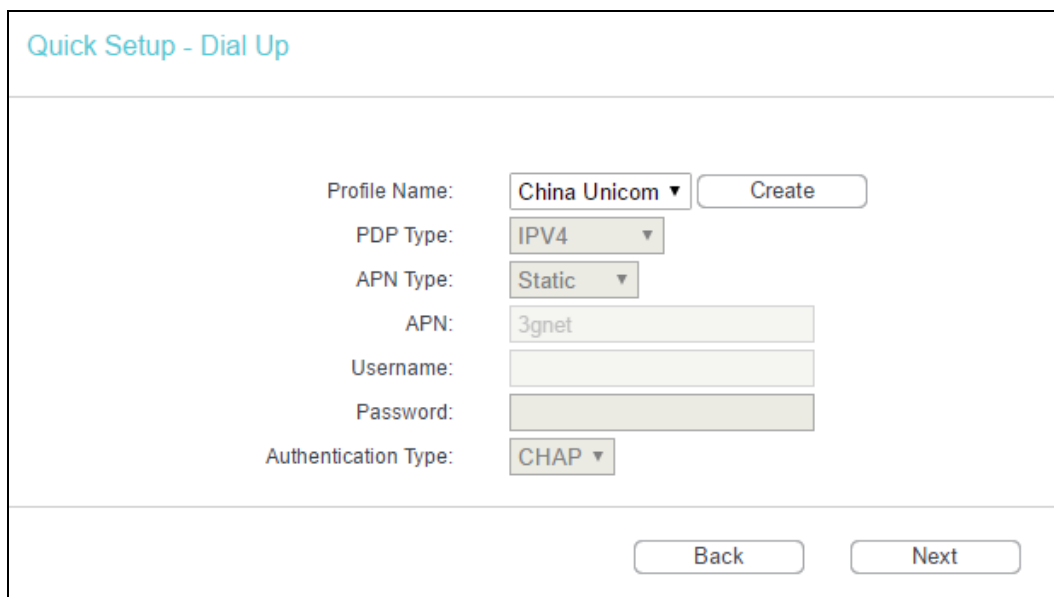

Run the Quick Setup to manually configure your internet connection and wireless settings.

To continue, please click the **Next** button.

To exit, please click the **Exit** button.

[Exit](#) [Next](#)

6. Choose your [Timezone](#), and then click [Next](#).
7. The Dial Up page shows the ISP information of the SIM card inserted. Click [Next](#) to continue if you are sure the information is correct. If these settings are not correct, please click [Create](#) to create a new profile with the correct parameters, and then choose the new profile from the [Profile Name List](#).

Quick Setup - Dial Up

Profile Name: [Create](#)

PDP Type:

APN Type:

APN:

Username:

Password:

Authentication Type:

[Back](#) [Next](#)

8. Set your wireless parameters. It's recommended that you edit the following two items, and then click [Next](#).
 - 1) Create a unique and easy-to-remember Wireless Network Name.
 - 2) Select [WPA-PSK/WPA2-PSK](#) under Wireless Security and enter a password in the field.

Quick Setup - Wireless

The Internet settings have been completed, now please configure the wireless settings.

Wireless Radio:

Wireless Network Name: (Also called the SSID)

Wireless Security:

Disable Security

WPA-PSK/WPA2-PSK

Wireless Password:

(You can enter ASCII characters between 8 and 63 or Hexadecimal characters between 8 and 64.)

No Change
(use the current security settings.)

More Advanced Wireless Settings

- Click **Finish** to make the settings effective.

Quick Setup - Finish

Congratulations!

The basic internet and wireless settings are finished, please click **Finish** button and test your internet connection.
If it is failed, please reboot your modem and wait 2 minutes or run the Quick Setup again.

3.2 Standard Wireless Router Mode

- Set up the TCP/IP Protocol in **Obtain an IP address automatically** mode on your PC. If you need instructions as to how to do this, please refer to [Appendix B: Configuring the PC](#).
- Connect your computer to the router (wired or wireless).

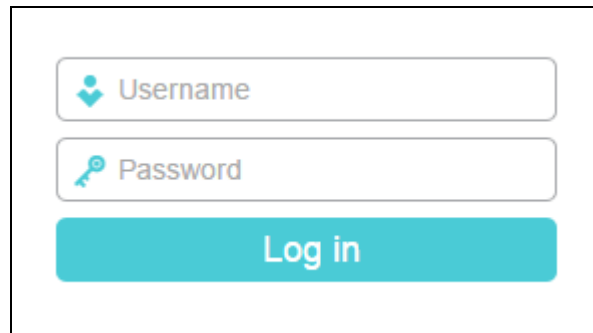

Wired: Connect your computer to the router's **LAN** port via an Ethernet cable.

Wireless: Connect wirelessly by using the SSID (network name) and Wireless Password printed on the product label at the bottom of the router.

- To access the configuration utility, open a web browser and type the default address <http://tplinkmodem.net> in the address field of the browser.

- After a moment, a login window will appear. Enter **admin** for the User Name and Password, both in lower case letters. Then click **Log in** or press the **Enter** key.

A login form with two input fields: 'Username' and 'Password'. Below the fields is a teal 'Log in' button.

 **Note:**

If the above screen does not pop-up, it means that your web browser has been set to a proxy. Go to [Tools](#) > [Internet Options](#) > [Connections](#) > [LAN Settings](#), in the screen that appears, cancel the Using Proxy checkbox, and click OK to finish it.

5. Go to [Working Mode](#) page, choose [Standard Wireless Router](#) and click [Save](#).

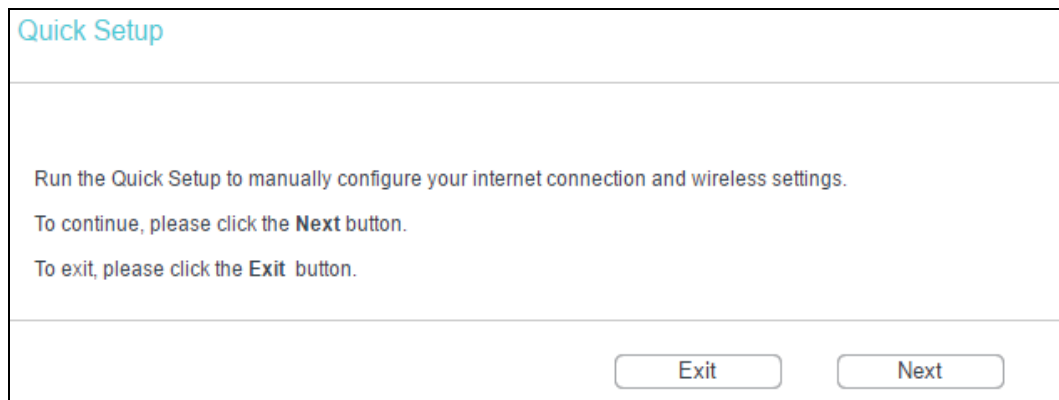

The 'Working Mode' screen shows two radio button options: 'Standard Wireless Router' (selected) and '3G/4G Router'. A 'Save' button is located at the bottom right.

 **Note:**

The router will reboot automatically after you click [Save](#).

6. Log in to the web management page again, go to [Quick Setup](#) and click [Next](#) to continue.

The 'Quick Setup' screen contains the following text: 'Run the Quick Setup to manually configure your internet connection and wireless settings. To continue, please click the **Next** button. To exit, please click the **Exit** button.' At the bottom, there are 'Exit' and 'Next' buttons.

7. Choose your [Timezone](#), and then click [Next](#).
8. Then [WAN Connection Type](#) page will appear. Select your connection type or click [Auto-Detect](#).

Quick Setup - WAN Connection Type

The Quick Setup is preparing to set up your internet connection, please choose one type below according to your ISP. The detailed description will be displayed after you choose the corresponding type.

Auto-Detect

Let the router automatically detect the internet connection type provided by your ISP.

Dynamic IP (Most Common Cases)

Static IP

PPPoE/Russian PPPoE

L2TP/Russian L2TP

PPTP/Russian PPTP

Note: For users in some areas (such as Russia, Ukraine etc.), please contact your ISP to choose connection type manually.

 **Note:**

- 1) **L2TP** and **PPTP** cannot be detected by the router. You must select it manually.
- 2) Before continuing, please make sure the cable of the WAN port is well connected to your device. If the WAN port is not connected, **the cable is unplugged** page will appear

Setup Wizard - WAN Connection Type

The cable is unplugged.

Before continuing, please make sure the cable of the WAN port is well connected to your device.

9. If you select **Auto-Detect**, the router will automatically detect the connection type your ISP provides. The appropriate configuration page will be displayed when an active internet service is successfully detected by the router.
 - If the connection type is **Dynamic IP**, the MAC Clone page appears. In most cases, there is no need to clone the MAC address. You can select “**No, I am connected by another computer (do NOT clone MAC address)**” and then click **Next**. If it is necessary in your case, please select “**Yes, I am connected by the main router (clone MAC address)**” and then click **Next**.

Quick Setup - MAC Clone

Please read help carefully on the right.

Yes, I am connected by the main computer (clone MAC address).
 No, I am connected by another computer (do NOT clone MAC address).

WAN MAC Address:
 Your PC's MAC Address:

- If the connection type is [Static IP](#), the next screen will appear.

Quick Setup - Static IP

IP Address:
 Subnet Mask:
 Default Gateway:
 Primary DNS:
 Secondary DNS: (Optional)

- [IP Address](#) - This is the WAN IP address as seen by external users on the internet (including your ISP). Enter the IP address into the field.
- [Subnet Mask](#) - The Subnet Mask is used for the WAN IP address, it is usually 255.255.255.0.
- [Default Gateway](#) - Enter the gateway IP address into the blank.
- [Primary DNS](#) - Enter the DNS Server IP address into the blank.
- [Secondary DNS](#) - If your ISP provides another DNS server, enter it into this field.
- If the connection type is [PPPoE/Russian PPPoE](#), the next screen will appear. Configure the following parameters and then click [Next](#).

- **User Name and Password** - Enter the **User Name** and **Password** provided by your ISP. These fields are case sensitive. If you have difficulty with this process, please contact your ISP.
- **Confirm Password** - Re-enter the password provided by your ISP to ensure the Password you entered is correct.

Check the radio button of **Dynamic/Static IP** to activate the secondary connection if your ISP provides an extra Connection type such as Dynamic/Static IP to connect to a local area network.

- If the connection type is **L2TP/Russian L2TP**, the next screen will appear as shown below. Configure the following parameters and then click **Next**.

- **User Name and Password** - Enter the **User Name** and **Password** provided by your ISP. These fields are case sensitive. If you have difficulty with this process, please contact your ISP.
- **Confirm Password** - Re-enter the password provided by your ISP to ensure the password you entered is correct.

Select [Dynamic IP](#) if none of IP Address, Subnet Mask, Gateway and DNS server address are provided. Then you just need to enter server IP address or domain name provided by your ISP.

Dynamic IP Static IP

Server IP Address/Name:

Select [Static IP](#) if the above parameters have been provided by your ISP. Then please enter server IP address or domain name provided by your ISP, and also enter the corresponding parameters.

Dynamic IP Static IP

Server IP Address/Name:

IP Address:

Subnet Mask:

Gateway:

DNS:

- If the connection type is [PPTP/Russian PPTP](#), the next screen will appear as shown below. Configure the following parameters and then click [Next](#).

Quick Setup - PPTP

User Name:

Password:

Confirm Password:

Dynamic IP Static IP

Server IP Address/Name:

- **User Name and Password** - Enter the **User Name** and **Password** provided by your ISP. These fields are case sensitive. If you have difficulty with this process, please contact your ISP.
- **Confirm Password** - Re-enter the password provided by your ISP to ensure the Password you entered is correct.

Select **Dynamic IP** if none of IP Address/ Subnet Mask/ Gateway and DNS server address are provided. Then you just need to enter server IP address or domain name provided by your ISP.

Select **Static IP** if the above parameters have been provided by your ISP. Then please enter server IP address or domain name provided by your ISP, and also enter the corresponding parameters.

10. Click **Next** to continue, the **Wireless** page will appear as shown below.

Quick Setup - Wireless

The Internet settings have been completed, now please configure the wireless settings.

Wireless Radio:

Wireless Network Name: (Also called the SSID)

Wireless Security:

Disable Security

WPA-PSK/WPA2-PSK

Wireless Password:

(You can enter ASCII characters between 8 and 63 or Hexadecimal characters between 8 and 64.)

No Change
(use the current security settings.)

More Advanced Wireless Settings

- **Wireless Radio** - Enable or disable the wireless function.
- **Wireless Network Name** - Enter a string of up to 32 characters. The same name of SSID (Service Set Identification) must be assigned to all wireless devices in your network. Considering your wireless network security, the default SSID is set to be TP-Link_XXXX (XXXX indicates the last unique four numbers of each router's MAC address). This value is case-sensitive. For example, *TEST* is NOT the same as *test*.
- **Disable Security** - The wireless security function can be enabled or disabled. If disabled, the wireless stations will be able to connect the router without encryption. It is recommended strongly that you choose one of following options to enable security.
- **WPA-PSK/WPA2-PSK** – Select WPA-PSK/WPA2-PSK based on pre-shared passphrase.
 - **Wireless Password** - You can enter **ASCII** or **Hexadecimal** characters.

For **ASCII**, the key can be made up of any numbers 0 to 9 and any letters A to Z, the length should be between 8 and 63 characters.

For **Hexadecimal**, the key can be made up of any numbers 0 to 9 and letters A to F, the length should be between 8 and 64 characters.

Please also note the key is case sensitive, this means that upper and lower case keys will affect the outcome. It would also be a good idea to write down the key and all related wireless security settings.
- **No Change** - If you chose this option, wireless security configuration will not change.

These settings are only for basic wireless parameters. For advanced settings, please refer to [4.7 Wirelss](#).

11. Click **Finish** to complete the **Quick Setup**.

Quick Setup - Finish

Congratulations! This device is now connecting you to the Internet. For detail settings, please click other menus if necessary.

Back

Finish

Chapter 4. 3G/4G Router Mode

This chapter will show each web page's key functions and the configuration way on 3G/4G Router Mode.

4.1 Login

After your successful login, you will see the main menus on the left of the web management page. On the right, there are the corresponding explanations and instructions.

Status
Quick Setup
WPS
Working Mode
Network
SMS
Wireless
Guest Network
DHCP
Forwarding
Security
Parental Control
Access Control
Advanced Routing
IP & MAC Binding
Dynamic DNS
System Tools
Logout

The detailed explanations for each web page's key function are listed below.

4.2 Status

The Status page provides the current status information about the device. All information is read-only.

Status	
Firmware Version:	1.0.12 Build 170223 Rev 000000
Hardware Version:	XXXXXXXXXX
IMEI:	XXXXXXXXXXXX

System Up Time:	0 days 17:40:52
<input type="button" value="Refresh"/>	

4.3 WPS

This section will guide you to add a new wireless device to an existing network quickly by [WPS \(Wi-Fi Protected Setup\)](#) function.

- a). Choose [WPS](#), and you will see the next screen.

The screenshot shows the WPS (Wi-Fi Protected Setup) configuration interface. At the top, it says "WPS (Wi-Fi Protected Setup)". Below that, there are several fields and buttons:

- SSID: TP-Link_60C4
- WPS Status: Enabled (with a "Disable WPS" button)
- Current PIN: 04428121 (with "Restore PIN" and "Gen New PIN" buttons)
- A checkbox labeled "Disable PIN of this device" (which is currently unchecked)
- An "Add a new device:" section with an "Add Device" button

- **WPS Status** - Enable or disable the WPS function here.
- **Current PIN** - The current value of this device's PIN displayed here. The default value can be found in the label.
- **Restore PIN** - Restore the PIN of this device to its default.
- **Gen New PIN** - Click this button, and then you can get a new random value for this device's PIN. You can ensure the network security by generating a new PIN.
- **Disable PIN of this device** - You can disable the router's PIN manually here. If the router receives multiple failed attempts to authenticate an external registrar, this function will be disabled automatically.
- **Add Device** - You can add the new device to the existing network manually by clicking this button.

b). To add a new device:

If the wireless adapter supports Wi-Fi Protected Setup (WPS), you can establish a wireless connection between wireless adapter and Router using either Push Button Configuration (PBC) method or PIN method.

 **Note:**

To build a successful connection by WPS, you should also do the corresponding configuration of the new device for WPS function meanwhile.

I. Use the Wi-Fi Protected Setup Button

Use this method if your client device has a WPS button.

Step 1: Press the WPS/RESET button on the back panel of the router.

You can also keep the default WPS Status as **Enabled** and click **Add Device**, then Choose "**Press the button of the new device in two minutes**" and click **Connect**.

Step 2: Press and hold the WPS button of the client device directly. The WPS LED flashes for two minutes during the Wi-Fi Protected Setup process.

Step 3: When the WPS LED is on, the client device has successfully connected to the router.

II. Enter the client device's PIN on the router

Use this method if your client device does not have the WPS button, but has a Wi-Fi Protected Setup PIN number.

Step 1: Keep the default WPS Status as Enabled and click [Add Device](#), then the following screen will appear.

Step 2: Enter the PIN number from the client device in the field on the WPS screen above. Then click [Connect](#).

Step 3: “[Connect successfully](#)” will appear, which means the client device has successfully connected to the router.

III. Enter the router's PIN on your client device

Use this method if your client device asks for the router's PIN number.

Step 1: On the client device, enter the PIN number listed on the router's Wi-Fi Protected Setup screen. (It is also labeled on the bottom of the router.)

Step 2: The Wi-Fi Protected Setup LED flashes for two minutes during the Wi-Fi Protected Setup process.

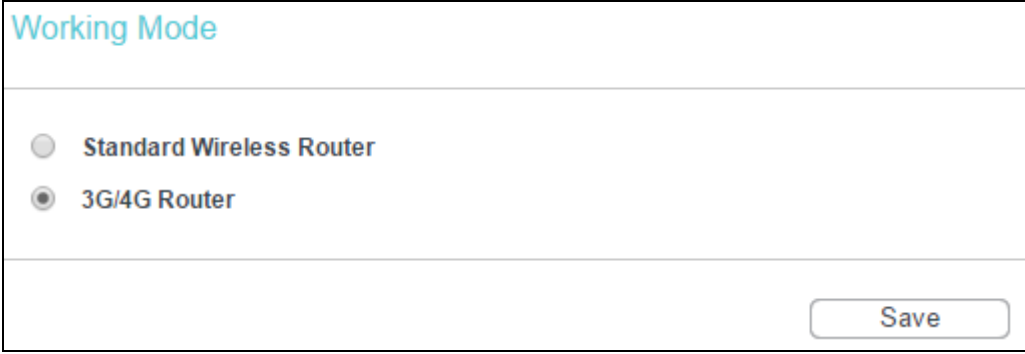

Step 3: When the WPS LED is on, the client device has successfully connected to the router.

Step 4: Refer back to your client device or its documentation for further instructions.

 **Note:**

- 1) The WPS LED on the router will light for five minutes if the device has been successfully added to the network.
- 2) The WPS function cannot be configured if the wireless function of the router is disabled. Please make sure the Wireless Function is enabled before configuring the WPS.

4.4 Working Mode

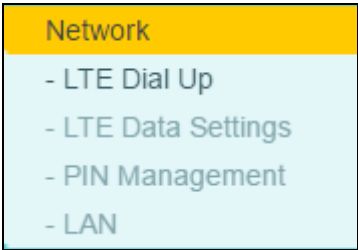

- **Standard Wireless Router** - In this mode, this device will only use LAN/WAN port to access internet. The inner hosts can access internet via 3 LAN ports or wireless.
- **3G/4G Router** - In this mode, this device enables multiusers to share internet via 3G/4G modem. The LAN/WAN port acts the same as a LAN port while at 3G/4G Router mode.

Click [Save](#) to make the settings effective.

 **Note:**

The router will reboot automatically after you click Save.

4.5 Network

There are four submenus under the Network menu: [LTE Dial Up](#), [LTE Data Settings](#), [PIN Management](#) and [LAN](#). Click any of them, and you will be able to configure the corresponding function.

4.5.1 LTE Dial Up

Go to [Network](#) → [LTE Dial Up](#), you can configure dial-up settings on this page.

Dial Up

Connection Status: Connected

Mobile Data: ▾

Data Roaming: ▾

Network Mode: ▾

Profile Name: ▾

PDP Type: ▾

APN Type: ▾

APN:

Username:

Password:

Authentication Type: ▾

- **Connection Status** - Shows whether the internet is connected or disconnected at present.
- **Mobile Data** - It is enabled by default. You can disable it to prohibit internet access.
- **Data Roaming** - It is disabled by default. If disabled, data service is not allowed when roaming. If enabled, data service is allowed when roaming, but may incur significant roaming charges.
- **Network Mode** - The device supports three modes of network connection - 4G Preferred, 4G Only, 3G Only. If your SIM card supports WCDMA, select 3G only; if your SIM card supports LTE, select 4G Preferred or 4G only as you need.
- **Profile Name** - A list of profile for you to select. After selecting one profile from the list, you can further modify its parameters. Show the name of the profile you've selected here.
- **PDP Type** - Select the type of your PDP (Packet Data Protocol).
- **APN Type** - Select the type of your APN, either Dynamic or Static. If you select Dynamic, the device will have dynamic APN, which does not need to be specified. If you select Static, you can manually specify your APN.
- **APN** - Access Point Name, provided by your ISP. You need to set APN only after selecting the static APN type. You are recommended to keep the default value.
- **Username/Password** - Enter the username and password provided by your ISP. These fields are case-sensitive. You are recommended to keep the default value.
- **Authentication Type** - Some ISPs need a specific authentication type, please confirm it with your ISP or keep the default value.
 - **None** - No any authentication is needed.

- **PAP** - Password Authentication Protocol. This protocol allows the device to establish authentication with the peer using two handshakes. Select this option if the ISP requires this authentication type.
- **CHAP** - Challenge Handshake Authentication Protocol. This protocol allows the device to establish authentication with the peer using three handshakes and checking the peer identity periodically. Select this option if the ISP requires this authentication type.

Click [Delete](#) to delete a profile.

Click [Create](#) to create a new profile.

Click [Save](#) to make the settings effective.

4.5.2 LTE Data Settings

Go to [Network](#) → [LTE Data Settings](#), you can configure data settings on this page.

Data Settings

Monthly Used:	0 MB	Correct
Data Limit:	<input type="text" value="Enable"/>	
Monthly Allowance:	<input type="text"/>	<input type="text" value="MB"/>
Monthly Data Statistic:	<input type="text" value="Enable"/>	
Start Date:	<input type="text" value="1"/>	

- **Total/Monthly Used** - Total/Monthly data used. You can click [Correct](#) and input the actual data amount to correct the data.
- **Data Limit** - You can enable or disable the function of data limit. If enabled, you can set the data quota and usage alert.
- **Total/Monthly Allowance** - Set the allowed amount of total/monthly data. When data usage exceeds the allowance, the device will disconnect internet and display a message on the screen asking whether to connect internet.
- **Monthly Data Statistic** - You can enable or disable the function of traffic data resetting.
- **Start Date** - Enable the function and schedule a date, the data will reset to zero on the date. If disabled, total data information is displayed. If enabled, monthly data information is displayed.

Click [Save](#) to make the settings effective.

4.5.3 PIN Management

Go to [Network](#) → [PIN Management](#), you can configure PIN code on this page.

The screenshot shows the 'PIN Management' settings interface. At the top, it displays 'SIM Card Status: PIN disabled'. Below that, 'PIN Management' is set to 'Enable' with a dropdown arrow. A text input field for 'PIN:' is empty, and to its right, it shows 'Remaining Attempts: 3'. There is an unchecked checkbox for 'Auto-unlock PIN upon Power-on:'. At the bottom center, there is an 'Apply' button.

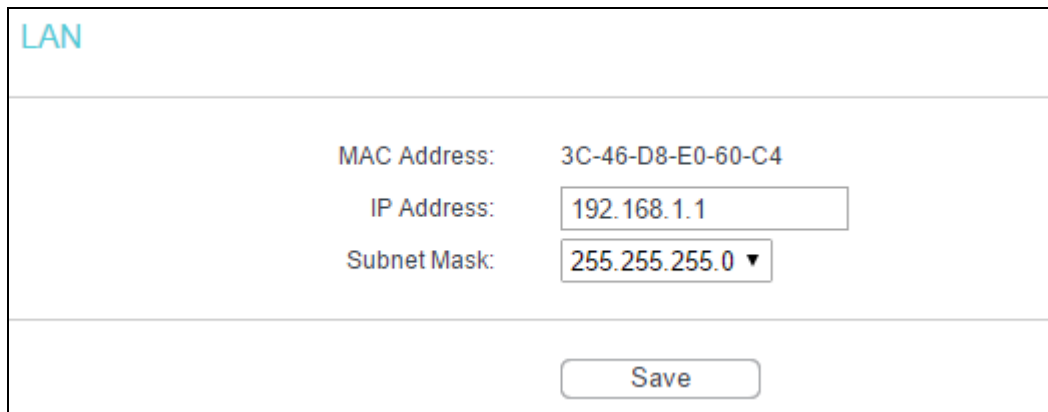

- [SIM Card Status](#) - Shows the status of your SIM card.
- [PIN Management](#) - You can select whether to enable this function or not. Once the PIN code function is enabled, every time you start the device with this SIM card inserted, you need to enter the PIN code. But you can go to enable the auto-unlock PIN function, which could save you this trouble.
- [PIN](#) - Personal Identification Number of the SIM card. It consists of 4-8 digits.
- [PUK](#) - PIN Unlocked Key. It consists of 8 digits.
- [Remaining Attempts](#) - Shows how many attempts are left for you to try entering the PIN or PUK code. You have 3 attempts at most for entering the PIN code and 10 attempts at most for entering the PUK code.
- [Auto-unlock PIN upon Power-on](#) - When the PIN code is required upon device restarting, it will be validated automatically once. If validation failed, you need to enter the PIN code on the Status page.

 **Note:**

1. If the current status of PIN is disabled, you can select [Enable](#) and set a PIN code, and then click [Apply](#) to make your settings take effect.
2. If the SIM current status is PIN enabled and verified, you can select [Disable](#) and enter the current PIN code, or select [Modify](#) and set a new PIN code, and then click [Apply](#) to make your settings take effect.

4.5.4 LAN

Go to [Network](#) → [LAN](#), You can configure the IP parameters of LAN on this page.

LAN

MAC Address: 3C-46-D8-E0-60-C4

IP Address: 192.168.1.1

Subnet Mask: 255.255.255.0 ▼

Save

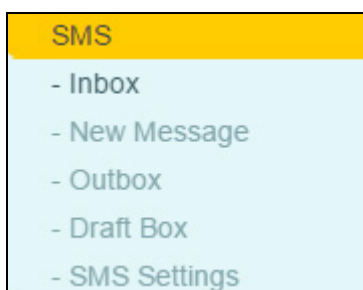

- **MAC Address** - The physical address of the LAN ports, as seen from the LAN. The value cannot be changed.
- **IP Address** - Enter the IP address of your Router in dotted-decimal notation (factory default - 192.168.1.1).
- **Subnet Mask** - An address code that determines the size of the network. Usually it is 255.255.255.0.

 **Note:**

1. If you change the LAN IP address, you must use the new IP address to log in to the router.
2. If the new LAN IP address you set is not in the same subnet with the previous one, the IP Address pool in the DHCP server will be configured automatically, but the Virtual Server and DMZ Host will not take effect until they are re-configured.

Click [Save](#) to make the settings effective.

4.6 SMS

There are five submenus under the Wireless menu: [Inbox](#), [New Message](#), [Outbox](#), [Draft Box](#), [SMS Settings](#). Click any of them, and you will be able to configure the corresponding function.

4.6.1 Inbox

The screenshot shows an 'Inbox' interface. At the top left, the word 'Inbox' is displayed. Below it is a table with four columns: 'Status', 'Phone Number', 'Content', and 'Received'. A small square icon is visible in the first row under the 'Status' column. Below the table, there are four buttons: 'Refresh', 'Delete', 'Previous', and 'Next'.

- **Status** - Show the status of message, either read or new.
- **Phone Number** - Shows the phone number that sent this message.
- **Content** - Click to unfold and read the detailed content of the message.
- **Received** - Shows the time when the message was received.

Click **Refresh** to refresh the inbox, and get any new message.

Click **Delete** to delete the message(s) you select.

Click **Previous** to get messages of the previous page.

Click **Next** to get messages of the next page.

4.6.2 New Message

The screenshot shows a 'New Message' interface. At the top left, the text 'New Message' is displayed. Below it is a form with two main sections: 'Phone Number' and 'Content'. The 'Phone Number' section has a text input field. The 'Content' section has a large text area with a character count '160/0' below it. At the bottom of the form, there are two buttons: 'Save' and 'Send'.

- **Phone Number** - Enter the receiver's phone number.
- **Content** - Text your message in this box. The message is limited to 160 letters or numbers, any exceeding characters will be sent in the next message.

Click **Send** to send the message.

Click **Save** to save the message to the draft box.

4.6.3 Outbox

- **Phone Number** - Shows the phone number that this message was planned to be sent to.
- **Content** - Click to unfold and read the detailed content of the message.
- **Sent** - Shows the time when the message was sent.

Click [Refresh](#) to refresh the outbox.

Click [Delete](#) to delete the message(s) you select.

Click [Previous](#) to get messages of the previous page.

Click [Next](#) to get messages of the next page.

4.6.4 Draft Box

You can review the unsent saved messages on this page.

- **Phone Number** - Shows the phone number that this message was planned to be sent to.
- **Content** - Click to unfold and read the detailed content of the message, or for further edition and delivery.

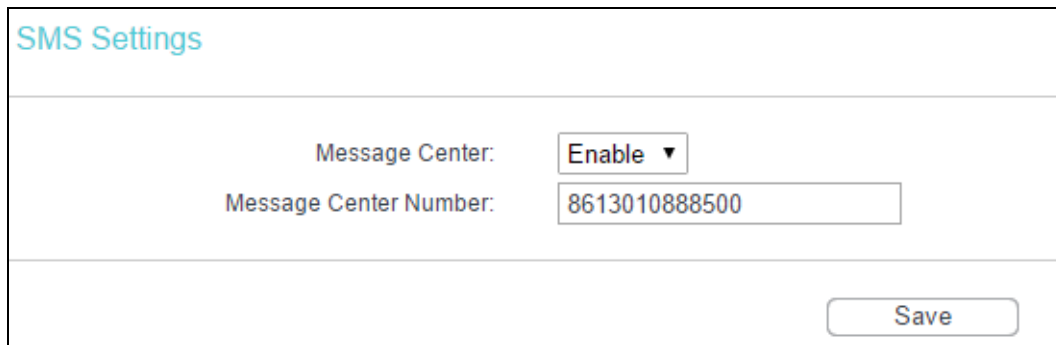

Click [Refresh](#) to refresh the drafts.

Click [Delete](#) to delete the message(s) you select.

Click [Previous](#) to get messages of the previous page.

Click [Next](#) to get messages of the next page.

4.6.5 SMS Settings

SMS Settings

Message Center:

Message Center Number:

- **Message Center** - Disabled by default. Do not enable it unless you want to manually set the message center number.
- **Message Center Number** - When the message center is enabled, you can enter the message center number of the local ISP. If you enter a wrong number, the message function would be affected.

Click [Save](#) to make the settings effective.

4.7 Wireless

There are five submenus under the Wireless menu: [Wireless Settings](#), [Wireless Security](#), [Wireless MAC Filtering](#), [Wireless Advanced](#) and [Wireless Statistics](#). Click any of them, and you will be able to configure the corresponding function.

4.7.1 Wireless Settings

Go to [Wireless](#) → [Wireless Settings](#), and then you can configure the basic settings for the wireless network on this page.

Wireless Settings

Wireless Network Name: (Also called the SSID)

Mode:

Channel Width:

Channel:

Enable Wireless Router Radio

Enable SSID Broadcast

Enable WDS Bridging

- **Wireless Network Name** - Enter a value of up to 32 characters. The same Name (SSID) must be assigned to all wireless devices in your network.
- **Mode** - Select transmission mode according to your wireless devices.
- **Channel Width** - The bandwidth of the wireless channel.
- **Channel** - This field determines which operating frequency will be used. It is not necessary to change the wireless channel unless you notice interference problems with another nearby access point. If you select auto, then AP will choose the best channel automatically.
- **Enable Wireless Router Radio** - The wireless radio of the router can be enabled or disabled to allow wireless stations access. If enabled, the wireless stations will be able to access the router. Otherwise, wireless stations will not be able to access the router.
- **Enable SSID Broadcast** - If you select the Enable SSID Broadcast checkbox, the wireless router will broadcast its name (SSID) on the air.
- **Enable WDS Bridging** - You can select this to enable WDS Bridging, with this function, the router can bridge two or more WLANs. If this checkbox is selected, you had better make sure the following settings are correct.

	<input checked="" type="checkbox"/> Enable WDS Bridging
SSID (to be bridged):	<input type="text"/>
BSSID (to be bridged):	<input type="text"/> Example:00-1D-0F-11-22-33
	<input type="button" value="Survey"/>
WDS Mode:	<input type="text" value="Auto"/>
Key type:	<input type="text" value="None"/>
WEP Index:	<input type="text" value="1"/>
Auth type:	<input type="text" value="open"/>
Password:	<input type="text"/>
<input type="button" value="Save"/>	

- **SSID (to be bridged)** - The SSID of the AP your router is going to connect to as a client. You can also use the survey function to select the SSID to join.
- **BSSID (to be bridged)** - The BSSID of the AP your Router is going to connect to as a client. You can also use the survey function to select the BSSID to join.
- **Survey** - Click this button, you can search the AP which runs in the current channel.
- **WDS Mode** - This field determines which WDS Mode will be used. It is not necessary to change the WDS Mode unless you notice network communication problems with root AP. If you select Auto, then Router will choose the appropriate WDS Mode automatically.
- **Key type** - This option should be chosen according to the AP's security configuration. It is recommended that the security type is the same as your AP's security type
- **WEP Index** - This option should be chosen if the key type is WEP (ASCII) or WEP (HEX).It indicates the index of the WEP key.
- **Auth Type** - This option should be chosen if the key type is WEP (ASCII) or WEP (HEX).It indicates the authorization type of the Root AP.
- **Password** - If the AP your Router is going to connect needs password, you need to fill the password in this blank.

4.7.2 Wireless Security

Go to [Wireless](#) → [Wireless Security](#), and then you can configure the security settings of your wireless network.

- **Disable Security** - If you do not want to use wireless security, select this check box, but it's strongly recommended to choose one of the following modes to enable security.
- **WPA/WPA2 – Personal (Recommended)** - It's the WPA/WPA2 authentication type based on pre-shared passphrase.
 - **Version** - you can choose the version of the WPA-PSK security on the drop-down list. The default setting is **Automatic**, which can select **WPA-PSK** (Pre-shared key of WPA) or **WPA2-PSK** (Pre-shared key of WPA2) automatically based on the wireless station's capability and request.
 - **Encryption** - you can select either **Automatic**, or **TKIP** or **AES** as Encryption.

Note:

If you check the **WPA/WPA2–Personal (Recommended)** radio button and choose TKIP encryption, you will find a notice in red as shown below.

- **Wireless Password** - You can enter ASCII or Hexadecimal characters. For Hexadecimal, the length should be between 8 and 64 characters; for ASCII, the length should be between 8 and 63 characters.
- **Group Key Update Period** - Specify the group key update interval in seconds. The value should be 30 or above. Enter 0 to disable the update.

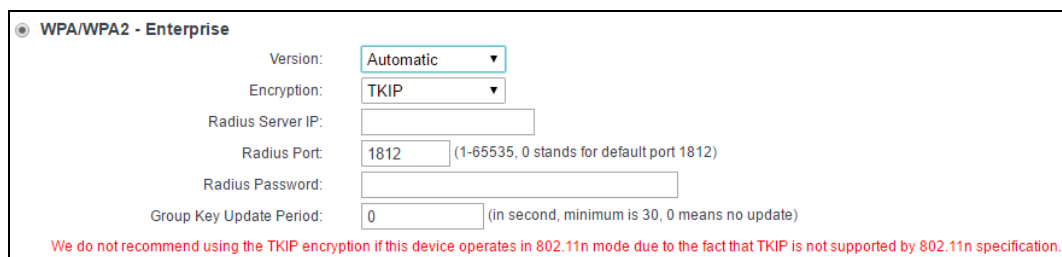

Click **Save** to make the settings effective.

➤ **WPA/WPA2 - Enterprise** - It's based on Radius Server.

- **Version** - you can choose the version of the WPA security on the pull-down list. The default setting is **Automatic**, which can select **WPA (Wi-Fi Protected Access)** or **WPA2 (WPA version 2)** automatically based on the wireless station's capability and request.
- **Encryption** - You can select either **Automatic**, or **TKIP** or **AES**.

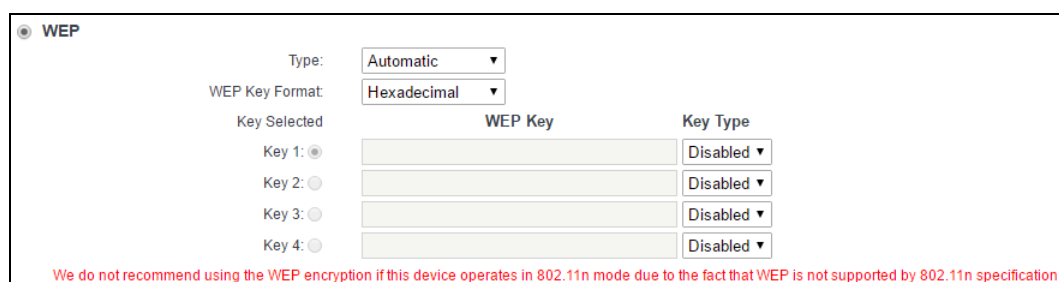

👉 **Note:**

If you check the **WPA/WPA2 - Enterprise** radio button and choose TKIP encryption, you will find a notice in red as shown below.

- **Radius Server IP** - Enter the IP address of the Radius Server.
- **Radius Port** - Enter the port that radius service used.
- **Radius Password** - Enter the password for the Radius Server.
- **Group Key Update Period** - Specify the group key update interval in seconds. The value should be 30 or above. Enter 0 to disable the update.

➤ **WEP** - It is based on the IEEE 802.11 standard. If you select this check box, you will find a notice in red as show below.

- **Type** - you can choose the type for the WEP security on the pull-down list. The default setting is **Automatic**, which can select **Open System** or **Shared Key** authentication type automatically based on the wireless station's capability and request.
- **WEP Key Format** - **Hexadecimal** and **ASCII** formats are provided. **Hexadecimal** format stands for any combination of hexadecimal digits (0-9, a-f, A-F) in the specified length. **ASCII** format stands for any combination of keyboard characters in the specified length.
- **WEP Key**- Select which of the four keys will be used and enter the matching WEP key that you create. Make sure these values are identical on all wireless stations in your network.
- **Key Type** - You can select the WEP key length (64bit, or 128bit, or 152bit.) for encryption. "Disabled" means this WEP key entry is invalid.

64bit - You can enter 10 hexadecimal digits (any combination of 0-9, a-f, A-F, null key is not permitted) or 5 ASCII characters.

128bit - You can enter 26 hexadecimal digits (any combination of 0-9, a-f, A-F, null key is not permitted) or 13 ASCII characters.

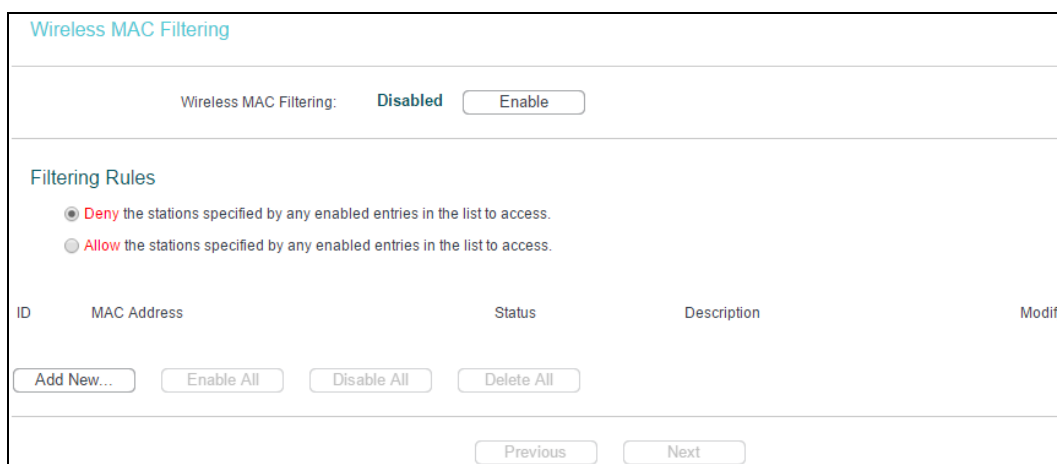

152bit - You can enter 32 hexadecimal digits (any combination of 0-9, a-f, A-F, null key is not permitted) or 16 ASCII characters.

 **Note:**

If you do not set the key, the wireless security function is still disabled even if you have selected Shared Key as Authentication Type.

4.7.3 Wireless MAC Filtering

Go to **Wireless** → **MAC Filtering**, and then you can control the wireless access by configuring the Wireless MAC Address Filtering function.

To filter wireless users by MAC Address, click **Enable**. The default setting is **Disable**.

- **MAC Address** - The wireless station's MAC address that you want to filter.
- **Status** - The status of this entry is either **Enabled** or **Disabled**.

- **Description** - A simple description of the wireless station.

To Add a Wireless MAC Address filtering entry, click [Add New....](#) The [Add or Modify Wireless MAC Address Filtering entry](#) page will appear:

To add a MAC Address Filtering entry, follow these instructions:

1. Enter the appropriate MAC Address into the [MAC Address](#) field. The format of the MAC Address is XX-XX-XX-XX-XX-XX (X is any hexadecimal digit). For example: 00-0A-EB-00-07-8A.
2. Enter a simple description of the wireless station in the [Description](#) field. For example: Wireless station A.
3. **Status** - Select [Enabled](#) or [Disabled](#) for this entry on the [Status](#) drop-down list.
4. Click [Save](#).

To modify an existing entry:

1. Click the [Modify](#) in the entry you want to modify.
2. Modify the information.
3. Click [Save](#).

Click [Delete](#) in the entry you want to delete to delete an existing entry.

Click [Enable All](#) to make all entries enabled.

Click [Disable All](#) to make all entries disabled.

Click [Delete All](#) to delete all entries.

Click [Next](#) to go to the next page.

Click [Previous](#) to return to the previous page.

For example: If you desire that the wireless station A with MAC address 00-0A-EB-00-07-8A and the wireless station B with MAC address 00-0A-EB-00-23-11 are able to access the router, but all the other wireless stations cannot access the router, you can configure the [Wireless MAC Address Filtering](#) list by following these steps:

1. Click [Enable](#) to enable this function.
2. Select the radio button: [Allow the stations not specified by any enabled entries in the list to access for Filtering Rules.](#)
3. Delete all or disable all entries if there are any entries already.
4. Click [Add New...](#) and enter the MAC address 00-0A-EB-00-07-8A /00-0A-EB-00-23-11 in the [MAC Address](#) field, then enter wireless station A/B in the [Description](#) field, while select [Enabled](#) in the [Status](#) drop-down list. Finally, click [Save](#).

The filtering rules that configured should be similar to the following list:

4.7.4 Wireless Advanced

Go to [Wireless](#) → [Wireless Advanced](#), and then you can configure the advanced settings of your wireless network.

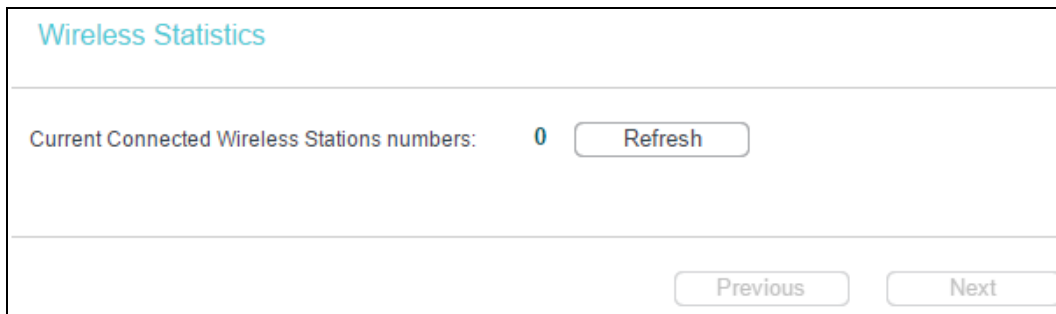

- **Transmit Power** - Here you can specify the transmit power of this device. You can select High, Middle or Low which you would like. High is the default setting and is recommended.
- **Beacon Interval** - The beacons are the packets sent by this device to synchronize a wireless network. Beacon Interval value determines the time interval of the beacons. You can specify a value between 40-1000 milliseconds. The default value is 100.
- **RTS Threshold** - Here you can specify the RTS (Request to Send) Threshold. If the packet is larger than the specified RTS Threshold size, this device will send RTS frames to a particular receiving station and negotiate the sending of a data frame. The default value is 2346.
- **Fragmentation Threshold** - This value is the maximum size determining whether packets will be fragmented. Setting the Fragmentation Threshold too low may result in poor network performance since excessive packets. 2346 is the default setting and is recommended. (This value for the mode of 11N series can not be changed)
- **DTIM Interval** - This value determines the interval of the Delivery Traffic Indication Message (DTIM). You can specify the value between 1-255 Beacon Intervals. The default value is 1, which indicates the DTIM Interval is the same as Beacon Interval.
- **Enable WMM** - WMM function can guarantee the packets with high- priority messages being transmitted preferentially. It is strongly recommended enabled.
- **Enable Short GI** - This function is recommended for it will increase the data capacity by reducing the guard interval time.
- **Enable AP Isolation** - Isolate all connected wireless stations so that wireless stations cannot access each other through WLAN. This function will be disabled if WDS/Bridge is enabled.

 **Note:**

If you are not familiar with the setting items in this page, it's strongly recommended to keep the provided default values; otherwise it may result in lower wireless network performance.

4.7.5 Wireless Statistics

Go to [Wireless](#) → [Wireless Statistics](#), and then you can see the MAC Address, Current Status, Received Packets and Sent Packets for each connected wireless station.

- **MAC Address** - The connected wireless station's MAC address.
- **Current Status** - The connected wireless station's running status, one of **STA-AUTH / STA-ASSOC / STA-JOINED / WPA / WPA-PSK / WPA2 / WPA2-PSK / AP-UP / AP-DOWN / Disconnected**.
- **Received Packets** - Packets received by the station.
- **Sent Packets** - Packets sent by the station.
- **Configure** - The button is used for loading the item to the Wireless MAC Filtering list.
Deny: if the Wireless MAC Filtering function is enabled, deny the station to access.
Allow: if the Wireless MAC Filtering function is enabled, allow the station to access.

You cannot change any of the values on this page. To update this page and to show the current connected wireless stations, click [Refresh](#).

If the numbers of connected wireless stations go beyond one page, click [Next](#) to go to the next page and click [Previous](#) to return to the previous page.

 **Note:**

This page will be refreshed automatically every 5 seconds.

4.8 Guest Network

There are two submenus under the Guest Network menu: [Wireless Settings](#) and [Wireless Statistics](#). Click any of them, and you will be able to configure the corresponding function.

4.8.1 Wireless Settings

Go to [Guest Network](#) → [Wireless Settings](#), you can configure the basic settings for the Guest network on this page.

Guest Network Wireless Settings

Access

Allow Guest To Access My Local Network:

Wireless

Guest Network:

Network Name: (Also called the SSID)

Wireless Security:

Access Time: can not be connected.

Everyday Select Days

Mon Tue Wed Thu Fri Sat Sun

All day-24 Hours

Start Time: (HHMM)

End Time: (HHMM)

- [Allow Guest To Access My Local Network](#) - If enabled, guests can communicate with hosts.
- [Guest Network](#) - Enabled or disable the Guest Network function here.
- [Network Name](#) - Enter a value of up to 32 characters. The same Name (SSID) must be assigned to all wireless devices in your Guest Network.
- [Wireless Security](#) - You can configure the security of Guest Network here.
- [Access Time](#) - During the time the wireless stations could accessing the router.

4.8.2 Wireless Statistics

Go to [Guest Network](#) → [Wireless Statistics](#), and then you can see the MAC Address, Current Status, Received Packets and Sent Packets for each connected wireless station.

Guest network Wireless Statistics

Current Connected Wireless Stations numbers: 0

- [MAC Address](#) - The connected wireless station's MAC address.
- [Current Status](#) - The connected wireless station's running status, one of [STA-AUTH](#) / [STA-ASSOC](#) / [STA-JOINED](#) / [WPA](#) / [WPA-PSK](#) / [WPA2](#) / [WPA2-PSK](#) / [AP-UP](#) / [AP-DOWN](#) / [Disconnected](#).
- [Received Packets](#) - Packets received by the station.

- [Sent Packets](#) - Packets sent by the station.
- [Configure](#) - The button is used for loading the item to the Wireless MAC Filtering list.
 - [Deny](#): if the Wireless MAC Filtering function enable, deny the station to access.
 - [Allow](#): if the Wireless MAC Filtering function enable, allow the station to access.

You cannot change any of the values on this page. To update this page and to show the current connected wireless stations, click [Refresh](#).

If the numbers of connected wireless stations go beyond one page, click [Next](#) to go to the next page and click [Previous](#) to return to the previous page.

 **Note:**

This page will be refreshed automatically every 5 seconds.

4.9 DHCP

There are three submenus under the DHCP menu: [DHCP Settings](#), [DHCP Client List](#) and [Address Reservation](#). Click any of them, and you will be able to configure the corresponding function.

4.9.1 DHCP Settings

Go to [DHCP](#) → [DHCP Settings](#), and then you can configure the DHCP Server on the page. The router is set up by default as a DHCP (Dynamic Host Configuration Protocol) server, which provides the TCP/IP configuration for all the PC(s) that are connected to the router on the LAN.

DHCP Settings

DHCP Server: Disable Enable

Start IP Address:

End IP Address:

Address Lease Time: minutes (1~2880 minutes, the default value is 120)

Default Gateway:

Default Domain: (Optional)

Primary DNS: (Optional)

Secondary DNS: (Optional)

- **DHCP Server** - **Enable** or **Disable** the DHCP server. If you disable the Server, you must have another DHCP server within your network or else you must configure the computer manually.
- **Start IP Address** - Specify an IP address for the DHCP Server to start with when assigning IP addresses. 192.168.1.100 is the default start address.
- **End IP Address** - Specify an IP address for the DHCP Server to end with when assigning IP addresses. 192.168.1.199 is the default end address.
- **Address Lease Time** - The **Address Lease Time** is the amount of time a network user will be allowed connection to the router with their current dynamic IP Address. Enter the amount of time in minutes and the user will be "leased" this dynamic IP Address. After the time is up, the user will be automatically assigned a new dynamic IP address. The range of the time is 1 ~ 2880 minutes. The default value is 120 minutes.
- **Default Gateway** - (Optional) Suggest to input the IP address of the LAN port of the router, default value is 192.168.1.1.
- **Default Domain** - (Optional) Input the domain name of your network.
- **Primary DNS** - (Optional) Input the DNS IP address provided by your ISP. Or consult your ISP.
- **Secondary DNS** - (Optional) Input the IP address of another DNS server if your ISP provides two DNS servers.

 **Note:**

To use the DHCP server function of the router, you must configure all computers on the LAN as "Obtain an IP address automatically" mode. This function will take effect until this device reboots. Click **Save** to make the settings effective.

4.9.2 DHCP Client List

Go to **DHCP** → **DHCP Client List**, and then you can view the information about the clients attached to the router in the next screen.

DHCP Client List				
ID	Client Name	MAC Address	Assigned IP	Lease Time
1	TP-Link	CC-08-8D-19-0A-35	192.168.1.105	01:59:56

- **ID** - The index of the DHCP Client.
- **Client Name** - The name of the DHCP client.
- **MAC Address** - The MAC address of the DHCP client.
- **Assigned IP** - The IP address that the router has allocated to the DHCP client.

- **Lease Time** - The time of the DHCP client leased.

You cannot change any of the values on this page. To update this page and to show the current connected devices, click [Refresh](#).

4.9.3 Address Reservation

Go to **DHCP** → **Address Reservation**, and then you can view and add a reserved address for clients. When you specify a reserved IP address for a PC on the LAN, that PC will always receive the same IP address each time when it accesses the DHCP server. Reserved IP addresses should be assigned to the servers that require permanent IP settings.

Address Reservation				
ID	MAC Address	Reserved IP Address	Status	Modify
1	00-1D-0F-11-22-33	192.168.1.12	Enabled	Modify Delete

The change of Address Reservation will not take effect until this device reboots, please [click here](#) to reboot.

- **MAC Address** - The MAC address of the PC for which you want to reserve IP address.
- **Reserved IP Address** - The IP address of the router reserved.
- **Status** - The status of this entry is either **Enabled** or **Disabled**.

To Reserve IP addresses:

1. Click **Add New**

Add or Modify an Address Reservation Entry

MAC Address:

Reserved IP Address:

Status: Enabled ▼

2. Enter the MAC Address (The format for the MAC Address is XX-XX-XX-XX-XX-XX) and the IP address in dotted-decimal notation of the computer you wish to add.
3. Click **Save**.

To modify an existing entry:

1. Click the **Modify** in the entry you want to modify.
2. Modify the information.

3. Click [Save](#).

Click [Delete](#) in the entry you want to delete to delete an existing entry.

Click [Enable/ Disable All](#) to make all entries enabled/disabled.

Click [Delete All](#) to delete all entries.

Click [Next](#) to go to the next page and click [Previous](#) to return to the previous page.

4.10 Forwarding

There are four submenus under the Forwarding menu: [Virtual Servers](#), [Port Triggering](#), [DMZ](#) and [UPnP](#). Click any of them, and you will be able to configure the corresponding function.

4.10.1 Virtual Servers

Go to [Forwarding](#) → [Virtual Servers](#), you can view and add virtual servers. Virtual servers can be used for setting up public services on your LAN. A virtual server is defined as a service port, and all requests from internet to this service port will be redirected to the computer specified by the server IP. Any PC that was used for a virtual server must have a static or reserved IP address because its IP address may change when using the DHCP function.

- **Service Port** - The numbers of External Service Ports. You can enter a service port or a range of service ports (the format is XXX - YYY, XXX is Start port, YYY is End port).
- **Internal Port** - The Internal Service Port number of the PC running the service application. You can enter a specific port number, or leave it blank if the **Internal Port** is the same as the **Service Port**.
- **IP Address** - The IP Address of the PC providing the service application.
- **Protocol** - The protocol used for this application, either **TCP**, **UDP**, or **All** (all protocols supported by the router).
- **Status** - The status of this entry, "Enabled" means the virtual server entry is enabled. The status of this entry is either **Enabled** or **Disabled**.

To setup a virtual server entry:

1. Click **Add New...**

Add or Modify a Virtual Server Entry

Service Port: (XX-XX or XX)

Internal Port: (XX, Enter a specific port number or leave it blank)

IP Address:

Protocol: ▼

Status: ▼

Common Service Port: ▼

2. Select the service you want to use from the **Common Service Port** list. If the **Common Service Port** list does not have the service that you want to use, type the number of the service port or service port range in the **Service Port** box.
3. Type the IP Address of the computer in the **IP Address** box.
4. Select the protocol used for this application, either **TCP** or **UDP**, or **All**.
5. Select **Enabled** to enable the virtual server.
6. Click **Save**.

 **Note:**

It is possible that you have a computer or server that has more than one type of available service. If so, select another service, and type the same IP address for that computer or server.

To modify an existing entry:

1. Click the **Modify** in the entry you want to modify.
2. Modify the information.
3. Click **Save**.

Click **Delete** in the entry you want to delete to delete an existing entry.

Click **Enable/Disable All** to make all entries enabled/ disabled.

Click **Delete All** to delete all entries.

Click **Next** to go to the next page and click **Previous** to return the previous page.

 **Note:**

If you set the service port of the virtual server as 80, you must set the web management port on **Security** → **Remote Management** page to be any other value except 80 such as 8080. Otherwise there will be a conflict to disable the virtual server.

4.10.2 Port Triggering

Go to [Forwarding](#) → [Port Triggering](#), you can view and add port triggering in the next screen. Some applications require multiple connections, like internet games, video conferencing, internet telephoning and so on. Port Triggering is used for some of these applications that cannot work with a pure NAT Router.

Once the router is configured, the operation is as follows:

1. A local host makes an outgoing connection using a destination port number defined in the Trigger Port field.
 2. The router records this connection, opens the incoming port or ports associated with this entry in the Port Triggering table, and associates them with the local host.
 3. When necessary the external host will be able to connect to the local host using one of the ports defined in the [Incoming Ports](#) field.
- [Trigger Port](#) - The port for outgoing traffic. An outgoing connection using this port will "Trigger" this rule.
 - [Trigger Protocol](#) - The protocol used for Trigger Ports, either [TCP](#), [UDP](#), or [All](#) (all protocols supported by the router).
 - [Incoming Port](#) - The port or port range used by the remote system when it responds to the outgoing request. A response using one of these ports will be forwarded to the PC that triggered this rule. You can input at most 5 groups of ports (or port section). Every group of ports must be set apart with ",". For example, 2000-2038, 2050-2051, 2085, 3010-3030.
 - [Incoming Protocol](#) - The protocol used for Incoming Ports Range, either [TCP](#) or [UDP](#), or [ALL](#) (all protocols supported by the router).
 - [Status](#) - The status of this entry is either [Enabled](#) or [Disabled](#).

To add a new rule, follow the steps below.

1. Click the [Add New...](#) button, the next screen will pop-up.

Add or Modify a Port Triggering Entry

Trigger Port:

Trigger Protocol: All ▼

Incoming Ports:

Incoming Protocol: All ▼

Status: Enabled ▼

Common Applications: --Select One-- ▼

Save
Back

2. Select a common application from the [Common Applications](#) drop-down list, then the [Trigger Port](#) field and the [Incoming Ports](#) field will be automatically filled. If the [Common Applications](#) do not have the application you need, enter the [Trigger Port](#) and the [Incoming Ports](#) manually.
3. Select the protocol used for Trigger Port from the [Trigger Protocol](#) drop-down list, either [TCP](#), [UDP](#), or [All](#).
4. Select the protocol used for Incoming Ports from the [Incoming Protocol](#) drop-down list, either [TCP](#) or [UDP](#), or [All](#).
5. Select [Enable](#) in [Status](#) field.
6. Click [Save](#) to save the new rule.

To modify an existing entry:

1. Click the [Modify](#) in the entry you want to modify.
2. Modify the information.
3. Click [Save](#).

Click [Delete](#) in the entry you want to delete to delete an existing entry.

Click [Enable All](#) to make all entries enabled

Click [Disable All](#) to make all entries disabled.

Click [Delete All](#) to delete all entries.

Click [Next](#) to go to the next page and click [Previous](#) to return the previous page.

Note:

- 1) When the trigger connection is released, the according opening ports will be closed.
- 2) Each rule can only be used by one host on the LAN at a time. The trigger connection of other hosts on the LAN will be refused.
- 3) Incoming Port Ranges cannot overlap each other.

4.10.3 DMZ

Go to [Forwarding](#) → [DMZ](#), you can view and configure DMZ host in the screen. The DMZ host feature allows one local host to be exposed to the internet for a special-purpose service such as internet gaming or video conferencing. The router forwards packets of all services to the DMZ host. Any PC that is set to be DMZ host must have its DHCP client function disabled and should have a new static IP address assigned to it because its IP Address may change when using the DHCP function.

To assign a computer or server to be a DMZ server:

1. Click the [Enable](#) radio button
2. Enter the local host IP Address in the [DMZ Host IP Address](#) field
3. Click [Save](#).

4.10.4 UPnP

Go to [Forwarding](#) → [UPnP](#), you can view the information about [UPnP](#) (Universal Plug and Play) in the screen. The UPnP feature allows the devices, such as internet computers, to access the local host resources or devices as needed. UPnP devices can be automatically discovered by the UPnP service application on the LAN.

ID	App Description	External Port	Protocol	Internal Port	IP Address	Status
Refresh						

- [Current UPnP Status](#) - UPnP can be enabled or disabled by clicking the [Enable](#) or [Disable](#) button. This feature is enabled by default.
- [Current UPnP Settings List](#) - This table displays the current UPnP information.
 - [App Description](#) - The description provided by the application in the UPnP request

- **External Port** - External port, which the router opened for the application.
- **Protocol** - Shows which type of protocol is opened.
- **Internal Port** - Internal port, which the router opened for local host.
- **IP Address** - The UPnP device that is currently accessing the router.
- **Status** - The port's status displayed here. "Enabled" means that port is still active. Otherwise, the port is inactive.

Click **Enable** to enable UPnP.

Click **Disable** to disable UPnP.

Click **Refresh** to update the Current UPnP Settings List.

4.11 Security

There are three submenus under the Security menu: **Basic Security**, **Local Management** and **Remote Management**. Click any of them, and you will be able to configure the corresponding function.

4.11.1 Basic Security

Go to **Security** → **Basic Security**, you can configure the basic security.

Basic Security

Firewall

SPI Firewall: Enable Disable

VPN

PPTP Passthrough: Enable Disable

L2TP Passthrough: Enable Disable

IPSec Passthrough: Enable Disable

ALG

FTP ALG: Enable Disable

TFTP ALG: Enable Disable

H323 ALG: Enable Disable

RTSP ALG: Enable Disable

SIP ALG: Enable Disable

- **Firewall** - A firewall protects your network from the outside world. Here you can enable or disable the router's firewall.
 - **SPI Firewall** - SPI (Stateful Packet Inspection, also known as dynamic packet filtering) helps to prevent cyber attacks by tracking more state per session. It validates that the traffic passing through the session conforms to the protocol. SPI Firewall is enabled by factory default. If you want all the computers on the LAN exposed to the outside world, you can disable it.
- **VPN** - VPN Passthrough must be enabled if you want to allow VPN tunnels using IPSec, PPTP, or L2TP protocols to pass through the router's firewall.
 - **PPTP Passthrough** - PPTP Passthrough. Point-to-Point Tunneling Protocol (PPTP) allows the Point-to-Point Protocol (PPP) to be tunneled through an IP network. To allow PPTP tunnels to pass through the router, click **Enable**.
 - **L2TP Passthrough** - Layer Two Tunneling Protocol (L2TP) is the method used to enable Point-to-Point sessions via the internet on the Layer Two level. To allow L2TP tunnels to pass through the router, click **Enable**.
 - **IPSec Passthrough** - Internet Protocol security (IPSec) is a suite of protocols for ensuring private, secure communications over Internet Protocol (IP) networks, through the use of cryptographic security services. To allow IPSec tunnels to pass through the router, click **Enable**.
- **ALG** - It is recommended to enable Application Layer Gateway (ALG) because ALG allows customized Network Address Translation (NAT) traversal filters to be plugged into the gateway to support address and port translation for certain application layer "control/data" protocols such as FTP, TFTP, H323 etc.
 - **FTP ALG** - To allow FTP clients and servers to transfer data across NAT, click **Enable**.
 - **TFTP ALG** - To allow TFTP clients and servers to transfer data across NAT, click **Enable**.
 - **H323 ALG** - To allow Microsoft NetMeeting clients to communicate across NAT, click **Enable**.
 - **RTSP ALG** - To allow some media player clients to communicate with some streaming media servers across NAT, click **Enable**.
 - **SIP ALG** - To allow some multimedia clients to communicate across NAT, click **Enable**.

Click **Save** to make the settings effective.

4.11.2 Local Management

Go to **Security** → **Local Management**, you can configure the management rule. The management feature allows you to deny LAN computers from accessing the router.

Local Management

Management Rules

All the PCs on the LAN are allowed to access the Router's Web-Based Utility
 Only the PCs listed can browse the built-in web pages to perform Administrator tasks

MAC 1:

MAC 2:

MAC 3:

MAC 4:

Your PC's MAC Address:

By default, the radio button **All the PCs on the LAN are allowed to access the Router's Web-Based Utility** is selected. If you want to allow PCs with specific MAC Addresses to access the Setup page of the router's Web-Based Utility locally, from inside the network, click the radio button **Only the PCs listed can browse the built-in web pages to perform Administrator tasks**, and then enter each MAC Address in a separate field. The format for the MAC Address is XX-XX-XX-XX-XX-XX (X is any hexadecimal digit). Only the PCs with the MAC address listed can use the password to browse the built-in web pages to perform Administrator tasks and all the others will be blocked.

After click **Add**, your PC's MAC Address will be placed in the Control List above.

Click **Save** to make the settings effective.

 **Note:**

If your PC is blocked and you want to access the router again, press and hold down the WPS/RESET button on the rear panel of the router until the Power LED starts flashing to reset the router's factory defaults in the router's web management page.

4.11.3 Remote Management

Go to **Security** → **Remote Management**, you can configure the Remote Management function. This feature allows you to manage your Router from a remote location via the internet.

Remote Management

Web Management Port:

Remote Management IP Address: (Enter 255.255.255.255 for all)

- **Web Management Port** - Web browser access normally uses the standard HTTP service port 80. This Router's default remote management web port number is 80. For greater security, you can change the remote management web port to a custom port by entering

that number in the box provided. Choose a number between 1 and 65535 but do not use the number of any common service port.

- **Remote Management IP Address** - This is the current address you will use when accessing your Router from the internet. This function is disabled when the IP address is set to the default value of 0.0.0.0. To enable this function change 0.0.0.0 to a valid IP address. If set to 255.255.255.255, then all the hosts can access the router from internet.

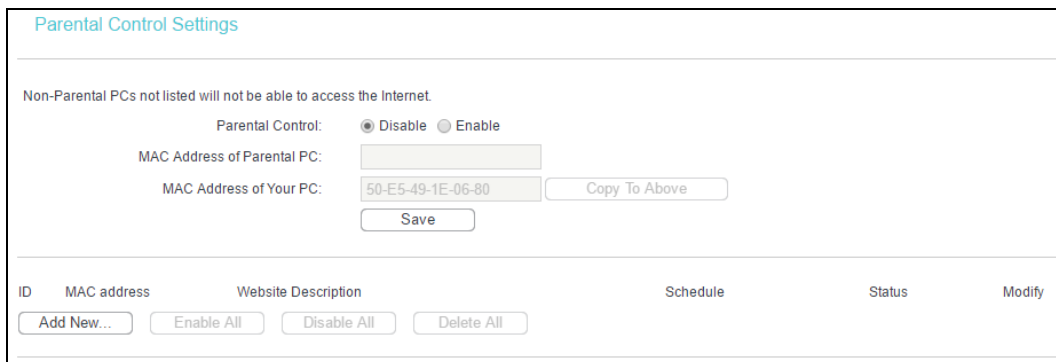

To access the router, you should enter your router's WAN IP address into your browser's address (in IE) or location (in Netscape) box, followed by a colon and the custom port number you set in the Web Management Port box. For example, if your Router's WAN address is 202.96.12.8 and you use port number 8080, enter `http://202.96.12.8:8080` in your browser. You will be asked for the router's password. After successfully entering the password, you will be able to access the router's web management page.

 **Note:**

- 1) Some ports are commonly used for other services (Such as 21, 25, 110, 119, 139, 145 and 445). For security reasons, these ports will be restricted.
- 2) Be sure to change the router's default password to a secure password.
- 3) If the web management port conflicts with the one used for a Virtual Server entry, the entry will be automatically disabled after the setting is saved.

4.12 Parental Control

Choose menu **Parental Control**, and you can configure the parental control. The Parental Control function can be used to control the internet activities of the child, limit the child to access certain websites and restrict the time of surfing. On this page, you can create the rule.

Parental Control Settings

Non-Parental PCs not listed will not be able to access the Internet.

Parental Control: Disable Enable

MAC Address of Parental PC:

MAC Address of Your PC:

ID	MAC address	Website Description	Schedule	Status	Modify
<input type="button" value="Add New..."/> <input type="button" value="Enable All"/> <input type="button" value="Disable All"/> <input type="button" value="Delete All"/>					

- **Parental Control** - Check **Enable** if you want this function to take effect, otherwise check **Disable**.
- **MAC Address of Parental PC** - In this field, enter the MAC address of the controlling PC, or you can make use of the **Copy To Above** button below.
- **MAC Address of Your PC** - This field displays the MAC address of the PC that is managing this router. If the MAC Address of your adapter is registered, you can click **Copy To Above** to fill this address to the MAC Address of Parental PC field above.
- **Website Description** - Description of the allowed website for the PC controlled.

- [Schedule](#) - The time period allowed for the PC controlled to access the internet. For detailed information, please go to [Access Control](#) → [Schedule](#).
- [Modify](#) - Here you can edit or delete an existing entry.

To add a new entry, please follow the steps below.

1. Click [Add New...](#) and the next screen will pop-up.

Add or Modify Parental Control Entry

The Schedule is based on the time of the Router. The time can be set in "System Tools -> [Time settings](#)".

MAC Address of Children's PC:	<input type="text"/>
All MAC Address In Current LAN:	<input type="text" value="--Please Select--"/>
Website Description:	<input type="text"/>
Allowed Website Name:	<input type="text"/>
	<input type="text"/>
	<input type="text"/>
	<input type="text"/>
	<input type="text"/>
	<input type="text"/>
	<input type="text"/>
	<input type="text"/>
Effective Time:	<input type="text" value="Anytime"/>
	The time schedule can be set in "Access Control -> Schedule "
Status:	<input type="text" value="Enabled"/>

2. Enter the MAC address of the PC (e.g. 00-11-22-33-44-AA) you'd like to control in the [MAC Address of Children's PC](#) field. Or you can choose the MAC address from the All Address in Current LAN drop-down list.
3. Give a description (e.g. Allow TP-Link) for the website allowed to be accessed in the [Website Description](#) field.
4. Enter the allowed domain name of the website, either the full name or the keywords (e.g. tp-link) in the Allowed Website Name field. Any domain name with keywords in it ([www.tp-link.com](#), [www.tp-link.com.cn](#)) will be allowed.
5. Select from the Effective Time drop-down list the schedule (e.g. Schedule_1) you want the entry to take effect. If there are not suitable schedules for you, click the [Schedule](#) in red below to go to the Advance Schedule Settings page and create the schedule you need.
6. In the Status field, you can select [Enabled](#) or [Disabled](#) to enable or disable your entry.
7. Click [Save](#).

Click [Enable All](#) to enable all the rules in the list.

Click [Disable All](#) to disable all the rules in the list.

Click [Delete All](#) to delete all the entries in the table.

Click [Next](#) to go to the next page, or click [Previous](#) return to the previous page.

For example: If you desire that the child PC with MAC address 00-11-22-33-44-AA can access www.tp-link.com on Saturday only while the parent PC with MAC address 00-11-22-33-44-BB is without any restriction, you should follow the settings below.

1. Choose [Parental Control](#) menu to enter the Parental Control Settings page. Check [Enable](#) and enter the MAC address 00-11-22-33-44-BB in the MAC Address of Parental PC field, then click [Save](#).
2. Go to [Access Control](#) → [Schedule](#) to enter the Schedule Settings page. Click [Add New...](#) button to create a new schedule with Schedule Description is Schedule_1, Day is Sat and Time is all day-24 hours, then click [Save](#).
3. Choose [Parental Control](#) menu to go back to the Add or Modify Parental Control Entry page:
 - 1) Click [Add New...](#)
 - 2) Enter 00-11-22-33-44-AA in the [MAC Address of Children's PC](#) field.
 - 3) Enter "Allow TP-Link" in the [Website Description](#) field.
 - 4) Enter "www.tp-link.com" in the [Allowed Website Name](#) field.
 - 5) Select "Schedule_1" you create just now from the [Effective Time](#) drop-down list.
 - 6) In [Status](#) field, select [Enable](#).
4. Click [Save](#) to complete the settings.

Then you will go back to the Parental Control Settings page and see the following list.

ID	MAC address	Website Description	Schedule	Status	Modify
1	00-11-22-33-44-AA	Allow TP-Link	Schedule_1	<input checked="" type="checkbox"/>	Edit Delete

4.13 Access Control

There are four submenus under the Access Control menu: [Rule](#), [Host](#), [Target](#) and [Schedule](#). Click any of them, and you will be able to configure the corresponding function.

4.13.1 Rule

Go to [Access Control](#) → [Rule](#), and then you can view and set Access Control rules.

- **Enable Internet Access Control** - Select the check box to enable the Internet Access Control function, so the Default Filter Policy can take effect.
- **Rule Name** - Here displays the name of the rule and this name is unique.
- **Host** - Here displays the host selected in the corresponding rule.
- **Target** - Here displays the target selected in the corresponding rule.
- **Schedule** - Here displays the schedule selected in the corresponding rule.
- **Enable** - Here displays the status of the rule, enabled or not. Check this option to enable a specific entry.
- **Modify** - Here you can edit or delete an existing rule.
- **Move** - You can change the entry's order as desired. Enter in the first box the ID number of the entry you want to move and in the second box another ID number, and then click the **Move** button to change the entries' order.

Click **Setup Wizard** to create a new rule entry.

Click **Add New...** to add a new rule entry.

Click **Enable All** to enable all the rules in the list.

Click **Disable All** to disable all the rules in the list.

Click **Delete All** to delete all the entries in the table.

Click **Next** to go to the next page, or click **Previous** to return to the previous page.

There are two methods to add a new rule.

Method One:

1. Click **Setup Wizard** and the next screen will appear.

- **Host Description** - In this field, create a unique description for the host (e.g. Host_1).
- **Mode** - Here are two options, **IP Address** and **MAC Address**. You can select either of them from the drop-down list.

If the **IP Address** is selected, you can see the following item:

- **LAN IP Address** - Enter the IP address or address range of the host in dotted-decimal format (e.g. 192.168.1.23).

If the **MAC Address** is selected, you can see the following item:

- **MAC Address** - Enter the MAC address of the host in XX-XX-XX-XX-XX-XX format (e.g. 00-11-22-33-44-AA).

2. Click **Next** when finishing creating the host entry, and the next screen will appear.

- **Target Description** - In this field, create a description for the target. Note that this description should be unique (e.g. Target_1).
- **Mode** - Here are two options, **IP Address** and **Domain Name**. You can choose either of them from the drop-down list.

If the **IP Address** is selected, you will see the following items:

- **IP Address** - Enter the IP address (or address range) of the target (targets) in dotted-decimal format (e.g. 192.168.1.23).
- **Target Port** - Specify the port or port range for the target. For some common service ports, you can make use of the Common Service Port item below.
- **Protocol** - Here are four options, All, TCP, UDP, and ICMP. Select one of them from the drop-down list for the target.
- **Common Service Port** - Here lists some common service ports. Select one from the drop-down list, and the corresponding port number will be filled in the Target Port field automatically. For example, if you select "FTP", "21" will be filled in the Target Port automatically.

If the **Domain Name** is selected, you will see the following items:

- **Domain Name** - Here you can enter 4 domain names, either the full name or the keywords (for example, tp-link). Any domain name with keywords in it (www.tp-link.com, www.tp-link.com.cn) will be blocked or allowed.

3. Click **Next** when finishing creating the access target entry, and the next screen will appear.

Quick Setup - Create an Advanced Schedule Entry

Note: The Schedule is based on the time of the Router.

Schedule Description:

Day: Everyday Select Days

Mon Tue Wed Thu Fri Sat Sun

Time: all day-24 hours:

Start Time: (HHMM)

Stop Time: (HHMM)

- **Schedule Description** - In this field, create a description for the schedule. Note that this description should be unique (e.g. Schedule_1).
- **Day** - Choose Select Days and select the certain day (days), or choose Everyday.
- **Time** - Select "24 hours", or specify the Start Time and Stop Time yourself.
- **Start Time** - Enter the start time in HHMM format (HHMM are 4 numbers). For example 0800 is 8:00.
- **Stop Time** - Enter the stop time in HHMM format (HHMM are 4 numbers). For example 2000 is 20:00.

- Click [Next](#) when finishing creating the advanced schedule entry, and the next screen will appear.

Quick Setup - Create an Internet Access Control Entry

Rule Name:

Host:

Target:

Schedule:

Status:

- **Rule Name** - In this field, create a name for the rule. Note that this name should be unique (e.g. Rule_1).
 - **Host** - In this field, select a host from the drop-down list for the rule. The default value is the [Host Description](#) you set just now.
 - **Target** - In this field, select a target from the drop-down list for the rule. The default value is the [Target Description](#) you set just now.
 - **Schedule** - In this field, select a schedule from the drop-down list for the rule. The default value is the [Schedule Description](#) you set just now.
 - **Status** - In this field, there are two options, [Enable](#) or [Disable](#). Select [Enable](#) so that the rule will take effect. Select [Disable](#) so that the rule won't take effect.
- Click [Finish](#) to complete adding a new rule.

Method Two:

- Click [Add New...](#) and the next screen will pop up as.
- Give a name (e.g. Rule_1) for the rule in the [Rule Name](#) field.
- Select a host from the [Host](#) drop-down list or choose "[Click Here To Add New Host List](#)".
- Select a target from the [Target](#) drop-down list or choose "[Click Here To Add New Target List](#)".
- Select a schedule from the [Schedule](#) drop-down list or choose "[Click Here To Add New Schedule](#)".
- In the [Status](#) field, select [Enabled](#) or [Disabled](#) to enable or disable your entry.
- Click [Save](#).

Add Internet Access Control Entry

Rule Name:	<input style="width: 90%;" type="text"/>		
Host:	<input style="width: 50%;" type="text" value="Host_1"/>	Click Here To Add New Host List.	
Target:	<input style="width: 50%;" type="text" value="Any Target"/>	Click Here To Add New Target List.	
Schedule:	<input style="width: 50%;" type="text" value="Anytime"/>	Click Here To Add New Schedule.	
Status:	<input style="width: 90%;" type="text" value="Enabled"/>		

For example: If you desire to allow the host with MAC address 00-11-22-33-44-AA to access www.tp-link.com only from 18:00 to 20:00 on Saturday and Sunday, and forbid other hosts in the LAN to access the internet, you should follow the settings below:

1. Click the submenu **Rule** of **Access Control** in the left to return to the Rule List page. Select Enable Internet Access Control and choose "Allow the packets specified by any enabled access control policy to pass through the router", then click **Save**.
2. We recommend that you click **Setup Wizard** to finish all the following settings.
3. Click the submenu **Host** of **Access Control** in the left to enter the Host List page. Add a new entry with the Host Description is Host_1 and MAC Address is 00-11-22-33-44-AA, then click **Save**.
4. Click the submenu **Target** of **Access Control** in the left to enter the Target List page. Add a new entry with the Target Description is Target_1 and Domain Name is www.tp-link.com, then click **Save**.
5. Click the submenu **Schedule** of **Access Control** in the left to enter the Schedule List page. Add a new entry with the Schedule Description is Schedule_1, Day is Sat and Sun, Start Time is 1800 and Stop Time is 2000, then click **Save**.
6. Click the submenu **Rule** of **Access Control** in the left, Click **Add New...** button to add a new rule as follows:
 - 1) In **Rule Name** field, create a name for the rule. Note that this name should be unique, for example Rule_1.
 - 2) In **Host** field, select Host_1.
 - 3) In **Target** field, select Target_1.
 - 4) In **Schedule** field, select Schedule_1.
 - 5) In **Status** field, select Enable.
 - 6) Click **Save** to complete the settings.

Then you will go back to the Access Control Rule Management page and see the following list.

ID	Rule Name	Host	Target	Schedule	Status	Modify
1	Rule_1	Host_1	Target_1	Schedule_1	<input checked="" type="checkbox"/>	Edit Delete

4.13.2 Host

Go to [Access Control](#) → [Host](#), you can view and set a Host list. The host list is necessary for the Access Control Rule.

ID	Host Description	Information	Modify
1	Host_1	IP: 192.168.1.23	Edit Delete

Buttons: [Add New...](#) [Delete All](#)

Page navigation: [Previous](#) [Next](#) Current No. Page

- [Host Description](#) - Here displays the description of the host and this description is unique.
- [Information](#) - Here displays the information about the host. It can be IP or MAC.
- [Modify](#) - To modify or delete an existing entry.

To add a new entry, please follow the steps below.

1. Click [Add New...](#)
2. In the [Mode](#) field, select IP Address or MAC Address.
 - If you select IP Address, you will see the screen shown as below.

Add or Modify a Host Entry

Mode:

Host Description:

LAN IP Address: -

Buttons: [Save](#) [Back](#)

- 1) In [Host Description](#) field, create a unique description for the host (e.g. Host_1).
- 2) In [LAN IP Address](#) field, enter the IP address.

- If you select MAC Address, you will see the screen shown as below.

Add or Modify a Host Entry

Mode:

Host Description:

MAC Address:

Buttons: [Save](#) [Back](#)

- 1) In [Host Description](#) field, create a unique description for the host (e.g. Host_1).

2) In **MAC Address** field, enter the MAC address.

3. Click **Save** to complete the settings.

Click **Delete All** to delete all the entries in the table.

Click **Next** to go to the next page, or click **Previous** to return to the previous page.

For example: If you desire to restrict the internet activities of host with MAC address 00-11-22-33-44-AA, you should first follow the settings below:

1. Click **Add New...** to enter the Add or Modify a Host Entry page.
2. In **Mode** field, select MAC Address from the drop-down list.
3. In **Host Description** field, create a **unique** description for the host (e.g. Host_1).
4. In **MAC Address** field, enter 00-11-22-33-44-AA.
5. Click **Save** to complete the settings.

Then you will go back to the Host Settings page and see the following list.

ID	Host Description	Information	Modify
1	Host_1	MAC: 00-11-22-33-44-AA	Edit Delete

4.13.3 Target

Go to **Access Control** → **Target**, you can view and set a Target list. The target list is necessary for the Access Control Rule.

Target Settings			
ID	Target Description	Information	Modify
<input type="button" value="Add New..."/> <input type="button" value="Delete All"/>			
		<input type="button" value="Previous"/> <input type="button" value="Next"/>	Current No. <input type="text" value="1"/> Page

- **Target Description** - Here displays the description about the target and this description is unique.
- **Information** - The target can be IP address, port, or domain name.
- **Modify** - To modify or delete an existing entry.

To add a new entry, please follow the steps below.

1. Click **Add New...**
2. In **Mode** field, select IP Address or Domain Name.
 - If you select **IP Address**, you will see the screen shown as below.

Add or Modify an Access Target Entry

Mode:

Target Description:

IP Address: -

Target Port: -

Protocol:

Common Service Port:

- 1) In **Target Description** field, create a unique description for the target (e.g. Target_1).
 - 2) In **IP Address** field, enter the IP address of the target.
 - 3) Select a common service from **Common Service Port** drop-down list, so that the **Target Port** will be automatically filled. If the **Common Service Port** drop-down list doesn't have the service you want, specify the **Target Port** manually.
 - 4) In **Protocol** field, select TCP, UDP, ICMP or ALL.
- If you select **Domain Name**, you will see the screen shown as below.

Add or Modify an Access Target Entry

Mode:

Target Description:

Domain Name:

- 1) In **Target Description** field, create a unique description for the target (e.g. Target_1).
 - 2) In **Domain Name** field, enter the domain name, either the full name or the keywords (for example tp-link) in the blank. Any domain name with keywords in it (www.tp-link.com, www.tp-link.com.cn) will be blocked or allowed. You can enter 4 domain names.
3. Click **Save**.

Click [Delete All](#) to delete all the entries in the table.

Click [Next](#) to go to the next page, or click [Previous](#) to return to the previous page.

For example: If you desire to restrict the internet activities of host with MAC address 00-11-22-33-44-AA in the LAN to access www.tp-link.com only, you should first follow the settings below:

1. Click [Add New...](#) to enter the Add or Modify an Access Target Entry page.
2. In [Mode](#) field, select Domain Name from the drop-down list.
3. In [Target Description](#) field, create a unique description for the target (e.g. Target_1).
4. In [Domain Name](#) field, enter www.tp-link.com.
5. Click [Save](#) to complete the settings.

Then you will go back to the Target Settings page and see the following list.

ID	Target Description	Information	Modify
1	Target_1	www.tp-link.com	Edit Delete

4.13.4 Schedule

Go to [Access Control](#) → [Schedule](#), you can view and set a Schedule list. The Schedule list is necessary for the Access Control Rule.

Schedule Settings				
ID	Schedule Description	Day	Time	Modify
<input type="button" value="Add New..."/> <input type="button" value="Delete All"/>				
				<input type="button" value="Previous"/> <input type="button" value="Next"/> Current No. <input type="text" value="1"/> Page

- [Schedule Description](#) - Here displays the description of the schedule and this description is unique.
- [Day](#) - Here displays the day(s) in a week.
- [Time](#) - Here displays the time period in a day.
- [Modify](#) - Here you can edit or delete an existing schedule.

To add a new schedule, follow the steps below.

1. Click [Add New...](#) and the next screen will pop-up.

Advance Schedule Settings

Note: The Schedule is based on the time of the Router.

Schedule Description:

Day: Everyday Select Days

Mon Tue Wed Thu Fri Sat Sun

Time: all day-24 hours:

Start Time: (HHMM)

Stop Time: (HHMM)

2. In [Schedule Description](#) field, create a unique description for the schedule (e.g. Schedule_1).
3. In [Day](#) field, select the day or days you need.
4. In [Time](#) field, you can select all day-24 hours or you may enter the Start Time and Stop Time in the corresponding field.
5. Click [Save](#) to complete the settings.

Click [Delete All](#) to delete all the entries in the table.

Click [Next](#) to go to the next page, or click [Previous](#) to return to the previous page.

For example: If you desire to restrict the internet activities of host with MAC address 00-11-22-33-44-AA to access www.tp-link.com only from 18:00 to 20:00 on [Saturday](#) and [Sunday](#), you should first follow the settings below:

1. Click [Add New...](#) to enter the Advanced Schedule Settings page.
2. In [Schedule Description](#) field, create a unique description for the schedule (e.g. Schedule_1).
3. In [Day](#) field, check the Select Days radio button and then select Sat and Sun.
4. In [Time](#) field, enter 1800 in Start Time field and 2000 in Stop Time field.
5. Click [Save](#) to complete the settings.

Then you will go back to the Schedule Settings page and see the following list.

ID	Schedule Description	Day	Time	Modify
1	Schedule_1	Sat Sun	18:00 - 20:00	Edit Delete

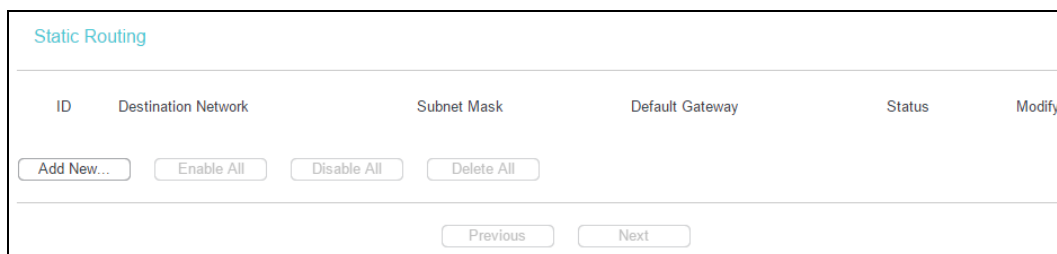

4.14 Advanced Routing

There are two submenus under the Advanced Routing menu: [Static Routing List](#) and [System Routing Table](#). Click any of them, and you will be able to configure the corresponding function.

4.14.1 Static Routing List

Go to [Advanced Routing](#) → [Static Routing List](#), you can configure the static route in the next screen. A static route is a pre-determined path that network information must travel to reach a specific host or network.

To add static routing entries:

1. Click [Add New...](#), you will see the following screen.

A screenshot of the 'Add or Modify a Static Route Entry' form. The form has a title 'Add or Modify a Static Route Entry'. It contains four input fields: 'Destination Network:', 'Subnet Mask:', 'Default Gateway:', and 'Status:'. The 'Status' field is a dropdown menu currently set to 'Enabled'. At the bottom of the form, there are two buttons: 'Save' and 'Back'.

2. Enter the following data:

- [Destination Network](#) - The [Destination Network](#) is the address of the network or host that you want to assign to a static route.
- [Subnet Mask](#) - The [Subnet Mask](#) determines which portion of an IP Address is the network portion, and which portion is the host portion.

- **Gateway** - This is the IP Address of the gateway device that allows for contact between the router and the network or host.

3. Select **Enabled** or **Disabled** for this entry on the **Status** pull-down list.

4. Click **Save** to make the entry effective.

Click **Delete** to delete the entry.

Click **Enable All** to enable all the entries.

Click **Disable All** to disable all the entries.

Click **Delete All** to delete all the entries.

Click **Previous** to view the information in the previous screen, click **Next** to view the information in the next screen.

4.14.2 System Routing Table

Go to **Advanced Routing** → **System Routing Table**, you can configure the system routing table in the next screen. System routing table views all of the valid route entries in use.

System Routing Table				
ID	Destination Network	Subnet Mask	Gateway	Interface
1	192.168.1.0	255.255.255.0	0.0.0.0	LAN & WLAN
2	10.20.89.0	255.255.255.0	0.0.0.0	WAN
3	239.0.0.0	255.0.0.0	0.0.0.0	LAN & WLAN
4	0.0.0.0	0.0.0.0	10.20.89.190	WAN

- **Destination Network** - The **Destination Network** is the address of the network or host to which the static route is assigned.
- **Subnet Mask** - The **Subnet Mask** determines which portion of an IP address is the network portion, and which portion is the host portion.
- **Gateway** - This is the IP address of the gateway device that allows for contact between the router and the network or host.
- **Interface** - This interface tells you whether the Destination IP Address is on the LAN & WLAN (internal wired and wireless networks), the WAN (internet).

4.15 IP & MAC Binding

IP & MAC Binding
- Binding Settings
- ARP List

There are two submenus under the IP & MAC Binding menu: [Binding Settings](#) and [ARP List](#). Click any of them, and you will be able to scan or configure the corresponding function. The detailed explanations for each submenu are provided below.

4.15.1 Binding Settings

This page displays the [Binding Settings](#) table, you can operate it in accord with your desire.

- [MAC Address](#) - The MAC address of the controlled computer in the LAN.
- [IP Address](#) - The assigned IP address of the controlled computer in the LAN.
- [Bind](#) - Check this option to enable ARP binding for a specific device.
- [Modify](#) - To modify or delete an existing entry.

When you want to add or modify an IP & MAC Binding entry, you can click [Add New](#) or [Modify](#), and then you will go to the next page. This page is used for adding or modifying an IP & MAC Binding entry.

To add IP & MAC Binding entries, follow the steps below.

1. Click [Add New](#)....
2. Enter the MAC Address and IP Address.
3. Select the Bind checkbox.
4. Click [Save](#).

To modify or delete an existing entry, follow the steps below.

1. Find the desired entry in the table.
2. Click [Modify](#) or [Delete](#) as desired on the [Modify](#) column.

To find an existing entry, follow the steps below.

1. Click [Find](#).
2. Enter the MAC Address or IP Address.
3. Click [Find](#) in the page as shown below.

[Find IP & MAC Binding Entry](#)

MAC Address:
 IP Address:

ID	MAC Address	IP Address	Bind	Link
Now the current list is empty.				

Click [Enable All](#) to make all entries enabled.

Click [Disable All](#) to make all entries disabled.

Click [Delete All](#) to delete all entries.

4.15.2 ARP List

To manage the computer, you could observe the computers in the LAN by checking the relationship of MAC address and IP address on the ARP list, and you could configure the items on the ARP list also. This page displays the ARP List; it shows all the existing IP & MAC Binding entries.

[ARP List](#)

ID	MAC Address	IP Address	Status	Configure
1	D0-25-98-6F-B9-06	192.168.1.103	Unbound	Load Delete
2	50-E5-49-1E-06-80	192.168.1.200	Unbound	Load Delete

- [MAC Address](#) - The MAC address of the controlled computer in the LAN.
- [IP Address](#) - The assigned IP address of the controlled computer in the LAN.
- [Status](#) - Indicates whether or not the MAC and IP addresses are bound.
- [Configure](#) - These buttons are for loading or deleting an item.

- **Load** - Load the item to the IP & MAC Binding list.
- **Delete** - Delete the item from the list.

Click the **Bind All** button to bind all the current items, available after enable.

Click the **Load All** button to load all items to the IP & MAC Binding list.

Click the **Refresh** button to refresh all items.

 **Note:**

An item cannot be loaded to the IP & MAC Binding list if the IP address of the item has been loaded before. Error warning will prompt as well. Likewise, "Load All" only loads the items have no interference with the IP & MAC Binding list.

4.16 Dynamic DNS

Choose menu **Dynamic DNS**, and you can configure the Dynamic DNS function.

The router offers a Dynamic Domain Name System (DDNS) feature. DDNS lets you assign a fixed host and domain name to a dynamic internet IP address. It is useful when you are hosting your own website, FTP server, or other server behind the router. Before using this feature, you need to sign up with DDNS service providers such as dyn.com, www.noip.com. The Dynamic DNS client service provider will give you a password or key.

4.16.1 dyn.com DDNS

If the dynamic DNS **Service Provider** you select is dyn.com, the page will appear.

DDNS

Service Provider: Dyndns (dyn.com) [Go to register..](#)

User Name:

Password:

Domain Name:

Enable DDNS

Connection Status: DDNS not launching!

To set up for DDNS, follow these instructions:

1. Enter the **User Name** for your DDNS account.

2. Enter the [Password](#) for your DDNS account.
3. Enter the [Domain Name](#) you received from dynamic DNS service provider here.
4. Click [Login](#) to log in to the DDNS service.

[Connection Status](#) - The status of the DDNS service connection is displayed here.

Click [Logout](#) to logout of the DDNS service.

 **Note:**

If you want to log in again with another account after a successful login, please click [Logout](#), then input your new username and password and click [Login](#).

4.16.2 [www.noip.com](#) DDNS

If the dynamic DNS [Service Provider](#) you select is [www.noip.com](#), the page will appear.

DDNS

Service Provider: No-IP (www.noip.com) ▾ [Go to register...](#)

User Name:

Password:

Domain Name:

Enable DDNS

Connection Status: DDNS not launching!

To set up for DDNS, follow these instructions:

1. Enter the [User Name](#) for your DDNS account.
2. Enter the [Password](#) for your DDNS account.
3. Enter the [Domain Name](#) you received from dynamic DNS service provider.
4. Click [Login](#) to log in the DDNS service.

[Connection Status](#) - The status of the DDNS service connection is displayed here.

Click [Logout](#) to log out the DDNS service.

 **Note:**

If you want to log in again with another account after a successful login, please click [Logout](#), then input your new username and password and click [Login](#).

4.17 System Tools

Choose [System Tools](#), and you can see the submenus under the main menu: [SNMP](#), [Time Settings](#), [Diagnostic](#), [Firmware Upgrade](#), [Factory Defaults](#), [Backup & Restore](#), [Reboot](#), [TR069](#), [Password](#) and [System Log](#). Click any of them, and you will be able to configure the corresponding function. The detailed explanations for each submenu are provided below.

4.17.1 SNMP

Simple Network Management Protocol (SNMP) is a popular network monitoring and management protocol.

- [SNMP Agent](#) - Choose [Enable](#) to open this function if you want to have remote control through SNMPv1/v2 agent with MIB-II. Choose [Disable](#) to close this function.

- **SysContact** - The textual identification of the contact person for this managed node.
- **SysName** - An administratively-assigned name for this managed node.
- **SysLocation** - The physical location of this node.

 **Note:**

Specifying one of these values via the Device's web management page makes the corresponding object read-only. If there isn't such a config setting, then the write request will succeed (assuming suitable access control settings), but the new value would be forgotten the next time the agent was restarted.

- **Get Community** - Enter the community name that allows Read-Only access to this device's SNMP information. The community name can be considered a group password. The default setting is **public**.
- **Get Source** - Get source defines the IP address or subnet for management systems that can read information from this 'get' community device.
- **Set Community** - Enter the community name that allows Read/Write access to this device's SNMP information. The community name can be considered a group password. The default setting is **private**.
- **Set Source** - Set source defines the IP address or subnet for management systems that can control this 'set' community device.

 **Note:**

A restricted source can be a specific IP address (e.g. 10.10.10.1), or a subnet - represented as IP/BITS (e.g. 10.10.10.0/24). If an IP Address of 0.0.0.0 is specified, the agent will accept all requests under the corresponding community name.

Click **Save** to make the settings effective.

4.17.2 Time Settings

Go to **System Tools** → **Time Settings**, and then you can configure the time on the following screen.

Time Settings

Time zone: (GMT) Greenwich Mean Time

Date: 3 14 2017 (MM/DD/YY)

Time: 2 59 53 (HH/MM/SS)

NTP Server 1: 0.0.0.0 (Optional)

NTP Server 2: 0.0.0.0 (Optional)

Get GMT

Enable DaylightSaving

Start: 2017 Mar 3rd Sun 2am

End: 2017 Nov 2nd Sun 3am

Daylight Saving Status:

Note: Click the "GET GMT" to update the time from the internet with the pre-defined servers or entering the customized server (IP Address or Domain Name) in the above frames.

Save

- **Time Zone** - Select your local time zone from this pull down list.
- **Date** - Enter your local date in MM/DD/YY into the right blanks.
- **Time** - Enter your local time in HH/MM/SS into the right blanks.
- **NTP Server 1/NTP Server 2** - Enter the address or domain of the **NTP Server 1** or **NTP Server 2**, and then the router will get the time from the NTP Server preferentially. In addition, the router built-in some common NTP Servers, so it can get time automatically once it connects the internet.
- **Enable Daylight Saving** - Check the box to enable the Daylight Saving function.
- **Start** - The time to start the Daylight Saving. Select the month in the first field, the week in the second field, the day in the third field and the time in the last field.
- **End** - The time to end the Daylight Saving. Select the month in the first field, the week in the second field, the day in the third field and the time in the last field.
- **Daylight Saving Status** - Displays the status whether the Daylight Saving is in use.

To set time manually:

1. Select your local time zone.
2. Enter the **Date** in Month/Day/Year format.
3. Enter the **Time** in Hour/Minute/Second format.
4. Click **Save**.

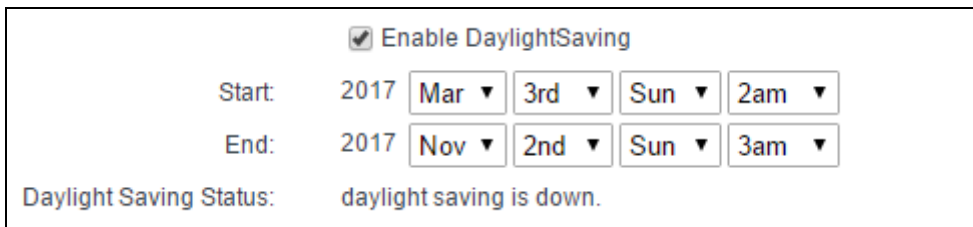

To set time automatically:

1. Select your local time zone.
2. Enter the address or domain of the **NTP Server 1** or **NTP Server 2**.

3. Click the [Get GMT](#) button to get system time from internet if you have connected to the internet.

To set up daylight saving:

1. Check the box to enable Daylight Saving.
2. Select the start time from the drop-down lists in the [Start](#) field.
3. Select the end time from the drop-down lists in the [End](#) field.
4. Click [Save](#) to make the settings effective.

Enable Daylight Saving

Start: 2017 Mar 3rd Sun 2am

End: 2017 Nov 2nd Sun 3am

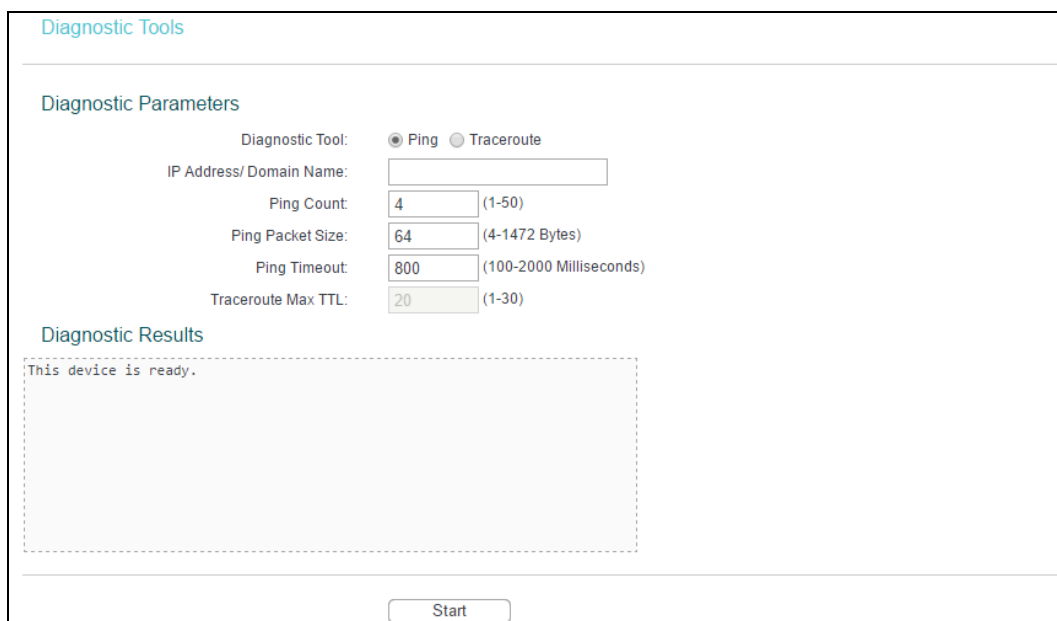

Daylight Saving Status: daylight saving is down.

 **Note:**

- 1) This setting will be used for some time-based functions such as firewall. You must specify your time zone once you log in to the router successfully, otherwise, these functions will not take effect.
- 2) The time will be lost if the router is turned off.
- 3) The router will automatically obtain GMT from the internet if it is configured accordingly.
- 4) In daylight saving configuration, start time shall be earlier than end time.

4.17.3 Diagnostic

Go to [System Tools](#) → [Diagnostic](#), you can transact Ping or Traceroute function to check connectivity of your network in the following screen.

Diagnostic Tools

Diagnostic Parameters

Diagnostic Tool: Ping Traceroute

IP Address/ Domain Name:

Ping Count: (1-50)

Ping Packet Size: (4-1472 Bytes)

Ping Timeout: (100-2000 Milliseconds)

Traceroute Max TTL: (1-30)

Diagnostic Results

This device is ready.

- **Diagnostic Tool** - Check the radio button to select one diagnostic tool.

- **Ping** - This diagnostic tool troubleshoots connectivity, reachability, and name resolution to a given host or gateway.
- **Traceroute** - This diagnostic tool tests the performance of a connection.

 **Note:**

You can use ping/traceroute to test both numeric IP address or domain name. If pinging/tracerouting the IP address is successful, but pinging/tracerouting the domain name is not, you might have a name resolution problem. In this case, ensure that the domain name you are specifying can be resolved by using Domain Name System (DNS) queries.

- **IP Address/Domain Name** - Enter the IP Address or Domain Name of the PC whose connection you wish to diagnose.
- **Pings Count** - Specifies the number of Echo Request messages sent. The default is 4.
- **Ping Packet Size** - Specifies the number of data bytes to be sent. The default is 64.
- **Ping Timeout** - Time to wait for a response, in milliseconds. The default is 800.
- **Traceroute Max TTL** - Set the maximum number of hops (max TTL to be reached) in the path to search for the target (destination). The default is 20.

Click **Start** to start the diagnostic procedure.

The **Diagnostic Results** page displays the result of diagnosis.

If the result is similar to the following screen, the connectivity of the internet is fine.

```

Diagnostic Results

Pinging 202.108.22.5 with 64 bytes of data:

Reply from 202.108.22.5: bytes=64 time=164 TTL=51 seq=1
Reply from 202.108.22.5: bytes=64 time=164 TTL=51 seq=2
Reply from 202.108.22.5: bytes=64 time=164 TTL=51 seq=3
Reply from 202.108.22.5: bytes=64 time=165 TTL=51 seq=4

Ping statistics for 202.108.22.5
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss)
Approximate round trip times in milliseconds:
Minimum = 164, Maximum = 165, Average = 164

```

 **Note:**

Only one user can use this tool at one time. Options “Ping Count”, “Ping Packet Size” and “Ping Timeout” are used for **Ping** function. Option “Traceroute Max TTL” are used for **Tracert** function.

4.17.4 Firmware Upgrade

Go to **System Tools** → **Firmware Upgrade**, you can update the latest version of firmware for the router on the following screen.

- **Firmware Version** - Displays the current firmware version.
- **Hardware Version** - Displays the current hardware version. The hardware version of the upgrade file must accord with the router's current hardware version.

To upgrade the router's firmware, follow these instructions below:

1. Download a more recent firmware upgrade file from the TP-Link official website (<http://www.tp-link.com>).
2. Click **Choose File**, then enter or select the path name where you save the downloaded file on the computer into the File Name blank.
3. Click **Upgrade**.
4. The router will reboot while the upgrading has been finished.

 **Note:**

The firmware version must correspond to the hardware. The upgrade process takes a few moments and this device restarts automatically when the upgrade is complete. It is important to keep power applied during the entire process. Loss of power during the upgrade could damage this device.

4.17.5 Factory Defaults

Go to **System Tools** → **Factory Defaults**, and you can restore the configurations of the router to factory defaults on the following screen.

Click **Restore** to reset all configuration settings to their default values.

- The default **Username**: admin
- The default **Password**: admin
- The default **IP Address**: 192.168.1.1
- The default **Subnet Mask**: 255.255.255.0

Note:

All changed settings will be lost when defaults are restored.

4.17.6 Backup & Restore

Go to [System Tools](#) → [Backup & Restore](#), you can save the current configuration of the router as a backup file and restore the configuration via a backup file.

- Click [Backup](#) to save all configuration settings to your local computer as a file.
- To restore this device's configuration, follow these instructions:
 - 1) Click [Choose File](#) to find the configuration file which you want to restore.
 - 2) Click [Restore](#) to update the configuration with the file whose path is the one you have input or selected in the blank.

Note:

The current configuration will be covered with the uploading configuration file. Wrong process will lead this device unmanaged. The restoring process lasts for 20 seconds and this device will restart automatically then. Keep the power of this device on during the process, in case of any damage.

4.17.7 Reboot

Go to [System Tools](#) → [Reboot](#), you can click [Reboot](#) to reboot the router.

Some settings of the router will take effect only after rebooting, which include

- Change the LAN IP Address (system will reboot automatically).
- Change the DHCP Settings.
- Change the Web Management Port.
- Upgrade the firmware of this device (system will reboot automatically).
- Restore this device's settings to the factory defaults (system will reboot automatically).
- Update the configuration with the file (system will reboot automatically).

4.17.8 TR069

TR-069 is a protocol for communication between a CPE and Auto-Configuration Server (ACS) that encompasses secure auto-configuration as well as other CPE management functions within a common framework.

- **TR069** - Enable or Disable the TR069 function. If you disable this function, your router (CPE) will not automatically configured by Auto-Configuration Server (ACS).
- **ACS URL** - This field specifies the URL for your router (CPE) to connect to the ACS.
- **User Name** - This field used to authenticate your router (CPE) when making a connection to the ACS. This username is used only for HTTP-based authentication of your router (CPE).
- **Password** - The Password used to authenticate your router (CPE) when making a connection to the ACS. This password is used only for HTTP-based authentication of your router (CPE).
- **Inform** - Whether or not your router (CPE) must periodically send CPE info to Server using the Inform method call.
- **Inform Interval** - The duration in seconds of the interval for which your router (CPE) MUST attempt to connect with the ACS and call the Inform method if PeriodicInform-Enable is true.
- **Connection Request User/Password** - Enter the username/password for the ACS server to log in to the router.
- **Connection Port** - Connection request server port, for an ACS to make a connection request notification to your router (CPE).

4.17.9 Password

Go to [System Tools](#) → [Password](#), you can change the factory default user name and password of the router in the next screen.

Password

Username and password can contain between 1 - 15 characters and may not include spaces.

Old User Name:

Old Password:

New User Name:

New Password:

Confirm New Password:

It is strongly recommended that you change the factory default user name and password of this device. All users who try to access this device's web management page will be prompted for this device's user name and password.

 **Note:**

The new username and password must not exceed 15 characters in length and must not include any spaces. Enter the new Password twice to confirm it.

Click [Save](#) when finished.

Click [Clear All](#) to clear all.

4.17.10 System Log

Go to [System Tools](#) → [System Log](#), you can view the logs of the router.

System Log

Auto Mail Feature: **Disabled**

Log Type: Log Level:

Index	Time	Type	Level	Log Content
1	5th day 19:57:31	OTHER	INFO	User clear system log.

Time = 2017-03-14 3:12:29 417451s
H-Ver = MR6400 v2 00000000 : S-Ver = 1.0.12 Build 170223 Rel.55039n
L = 192.168.1.64 : M = 255.255.255.0
W1 = DHCP : W = 192.168.0.100 : M = 255.255.255.0 : G = 0.0.0.0

Current No. Page

➤ **Auto Mail Feature** - Indicates whether auto mail feature is enabled or not.

- [Mail Settings](#) - Set the receiving and sending mailbox address, server address, validation information as well as the timetable for Auto Mail Feature.
- [Log Type](#) - By selecting the log type, only logs of this type will be shown.
- [Log Level](#) - By selecting the log level, only logs of this level will be shown.
- [Refresh](#) - Refresh the page to show the latest log list.
- [Save Log](#) - Click to save all the logs in a txt file.
- [Mail Log](#) - Click to send an email of current logs manually according to the address and validation information set in Mail Settings. The result will be shown in the later log soon.
- [Clear Log](#) - All the logs will be deleted from this device permanently, not just from the page.

Click [Next](#) to go to the next page, or click [Previous](#) return to the previous page.

Chapter 5. Standard Wireless Router Mode

This chapter will show each web page's key functions and the configuration way on Standard Wireless Router Mode.

5.1 Login

After your successful login, you will see the main menus on the left of the web management page. On the right, there are the corresponding explanations and instructions.

Status
Quick Setup
WPS
Working Mode
Network
Wireless
Guest Network
DHCP
Forwarding
Security
Parental Control
Access Control
Advanced Routing
Bandwidth Control
IP & MAC Binding
Dynamic DNS
IPv6 Support
System Tools
Logout

The detailed explanations for each web page's key function are listed below.

5.2 Status

The Status page provides the current status information about the router. All information is read-only.

Status		
Firmware Version:	V.0.12 Build 170223 Rel.00200a	
Hardware Version:	MR6400 v2 00000000	
IMEI:	353090000000000	
LAN		
MAC Address:	3C-46-D8-E0-60-C4	
IP Address:	192.168.1.1	
Subnet Mask:	255.255.255.0	
Wireless		
Wireless Radio:	Enable	
Name (SSID):	TP-Link_60C4	
Mode:	11bgn mixed	
Channel Width:	Automatic	
Channel:	Auto (Current channel 6)	
MAC Address:	3C-46-D8-E0-60-C4	
WDS Status:	Disable	
WAN		
MAC Address:	3C-46-D8-E0-60-C5	
IP Address:	192.168.0.169	Dynamic IP
Subnet Mask:	255.255.255.0	
Default Gateway:	192.168.0.1	<input type="button" value="Release"/>
DNS Server:	192.168.0.1 , 0.0.0.0	
System Up Time:	0 days 00:15:33	<input type="button" value="Refresh"/>

5.3 WPS

The configuration is similar to [WPS](#) in 3G/4G Router mode. Please refer to [4.3 WPS](#).

5.4 Working Mode

The configuration is similar to [Working Mode](#) in 3G/4G Router mode. Please refer to [4.4 Working Mode](#).

5.5 Network

Network
- WAN
- MAC Clone
- LAN
- VLAN

There are four submenus under the Network menu: [WAN](#), [MAC Clone](#), [LAN](#) and [VLAN](#). Click any of them, and you will be able to configure the corresponding function.

5.5.1 WAN

Go to [Network](#) → [WAN](#), and you can configure the IP parameters of the WAN on the screen below.

1. If your ISP provides the DHCP service, please choose [Dynamic IP](#) type, and the router will automatically get IP parameters from your ISP. You can see the page as follows:

WAN

WAN Connection Type: Dynamic IP Detect

IP Address: 192.168.0.169
 Subnet Mask: 255.255.255.0
 Default Gateway: 192.168.0.1

Renew Release

MTU Size (in bytes): 1500 (The default is 1500, do not change unless necessary.)

Use These DNS Servers

Primary DNS: 192.168.0.1
 Secondary DNS: 0.0.0.0 (Optional)

Host Name: TL-MR6400

Get IP with Unicast DHCP (It is usually not required.)

Save

This page displays the WAN IP parameters assigned dynamically by your ISP, including IP address, Subnet Mask, Default Gateway, etc. Click [Renew](#) to renew the IP parameters from your ISP. Click [Release](#) to release the IP parameters.

- **MTU Size** - The normal **MTU** (Maximum Transmission Unit) value for most Ethernet networks is 1500 Bytes. It is not recommended that you change the default **MTU Size** unless required by your ISP.
- **Use These DNS Servers** - If your ISP gives you one or two DNS addresses, select **Use These DNS Servers** and enter the primary and secondary addresses into the correct fields. Otherwise, the DNS servers will be assigned dynamically from your ISP.

 **Note:**

If you find error when you go to a web site after entering the DNS addresses, it is likely that your DNS servers are set up improperly. You should contact your ISP to get DNS server addresses.

- **Get IP with Unicast DHCP** - A few ISPs' DHCP servers do not support the broadcast applications. If you cannot get the IP Address normally, you can choose this option. (It is rarely required.)

2. If your ISP provides a static or fixed IP Address, Subnet Mask, Gateway and DNS setting, select **Static IP**. The Static IP settings page will appear as shown below.

WAN

WAN Connection Type: Static IP Detect

IP Address: 0.0.0.0

Subnet Mask: 0.0.0.0

Default Gateway: 0.0.0.0

MTU Size (in bytes): 1500 (The default is 1500, do not change unless necessary.)

Primary DNS: 0.0.0.0

Secondary DNS: 0.0.0.0 (Optional)

Save

- **IP Address** - Enter the IP address in dotted-decimal notation provided by your ISP.
- **Subnet Mask** - Enter the subnet Mask provided by your ISP in dotted-decimal notation. Usually, the Sub Mask is 255.255.255.0.
- **Default Gateway** - (Optional) Enter the gateway IP address provided by your ISP in dotted-decimal notation.

- **MTU Size** - The normal **MTU** (Maximum Transmission Unit) value for most Ethernet networks is 1500 Bytes. It is not recommended that you change the default **MTU Size** unless required by your ISP.
 - **Primary/Secondary DNS** - (Optional) Enter one or two DNS addresses in dotted-decimal notation provided by your ISP.
3. If your ISP provides a PPPoE connection, select **PPPoE/Russia PPPoE** option. And you should enter the following parameters:

WAN

WAN Connection Type: PPPoE/Russia PPPoE ▼ Detect

PPPoE Connection:

User Name:

Password:

Confirm Password:

Secondary Connection: Disabled Dynamic IP Static IP (For Dual Access/Russia PPPoE)

Wan Connection Mode: Connect on Demand
 Max Idle Time: minutes (0 means remain active at all times.)

Connect Automatically

Time-based Connecting
 Period of Time: from : (HH:MM) to : (HH:MM)

Connect Manually
 Max Idle Time: minutes (0 means remain active at all times.)

Connect Disconnect **Disconnected!**

Save Advanced

- **User Name/Password** - Enter the User Name and Password provided by your ISP. These fields are case-sensitive.
- **Confirm Password** - Re-enter the Password provided by your ISP to ensure the Password you entered is correct.
- **Secondary Connection** - It's available only for PPPoE Connection. If your ISP provides an extra Connection type such as Dynamic/Static IP to connect to a local area network, then you can check the radio button of Dynamic/Static IP to activate this secondary connection.
 - **Disabled** - The Secondary Connection is disabled by default, so there is PPPoE connection only. This is recommended.
 - **Dynamic IP** - You can check this radio button to use Dynamic IP as the secondary connection to connect to the local area network provided by ISP.

- [Static IP](#) - You can check this radio button to use Static IP as the secondary connection to connect to the local area network provided by ISP.
- [Connect on Demand](#) - In this mode, the internet connection can be terminated automatically after a specified inactivity period ([Max Idle Time](#)) and be re-established when you attempt to access the internet again. If you want your internet connection to keep active all the time, please enter "0" in the [Max Idle Time](#) field. Otherwise, enter the number of minutes you want to have elapsed before your internet access disconnects.
- [Connect Automatically](#) - The connection can be re-established automatically when it was down.
- [Time-based Connecting](#) - The connection will only be established in the period from the start time to the end time (both are in HH:MM format).

 **Note:**

Only when you have configured the system time on [System Tools](#) → [Time](#) page, will the [Time-based Connecting](#) function can take effect.

- [Connect Manually](#) - You can click [Connect/Disconnect](#) to connect/disconnect immediately. This mode also supports the [Max Idle Time](#) function as [Connect on Demand](#) mode. After a specified period of inactivity ([Max Idle Time](#)), the router will disconnect from your internet connection, and you will not be able to re-establish your connection automatically as soon as you attempt to access the internet again. To use this option, click the radio button. If you want your internet connection to remain active at all times, enter "0" in the [Max Idle Time](#) field. Otherwise, enter the number in minutes that you wish to have the internet connecting last unless a new link is requested.

Caution: Sometimes the connection cannot be terminated although you specify a time to Max Idle Time, since some applications are visiting the internet continually in the background.

If you want to do some advanced configurations, please click [Advanced](#), and the page shown below will appear:

PPPoE Advanced Settings

MTU Size (in bytes): (The default is 1480, do not change unless necessary.)

Service Name:

AC Name:

Use IP Address Specified by ISP

ISP Specified IP Address:

Detect Online Interval: Seconds (0 ~ 120 seconds, the default is 0, 0 means not detecting.)

Use The Following DNS Servers

Primary DNS:

Secondary DNS: (Optional)

- **MTU Size** - The default MTU size is “1480” bytes, which is usually fine. It is not recommended that you change the default **MTU Size** unless required by your ISP.
- **Service Name/AC Name** - The service name and AC (Access Concentrator) name, which should not be configured unless you are sure it is necessary for your ISP. In most cases, leaving these fields blank will work.
- **ISP Specified IP Address** - If your ISP does not automatically assign IP addresses to the Router during login, please click “**Use IP address specified by ISP**” check box and enter the IP address provided by your ISP in dotted-decimal notation.
- **Detect Online Interval** - The router will detect Access Concentrator online at every interval. The default value is “15”. You can input the value between “0”and “120”. The value “0” means no detect.
- **Primary DNS** - If your ISP does not automatically assign DNS addresses to the router during login, please click “**Use the following DNS servers**” check box and enter the IP address in dotted-decimal notation of your ISP’s primary DNS server.
- **Secondary DNS** - If your ISP provides another DNS server, enter it into this field.

Click the **Save** button to make the settings effective.

4. If your ISP provides BigPond Cable (or Heart Beat Signal) connection, please select **BigPond Cable**. And you should enter the following parameters:

WAN

WAN Connection Type:

User Name:

Password:

Auth Server:

Auth Domain:

MTU Size (in bytes): (The default is 1500, do not change unless necessary.)

Connection Mode:

Connect on Demand
 Max Idle Time: minutes (0 means remain active at all times.)

Connect Automatically

Connect Manually
 Max Idle Time: minutes (0 means remain active at all times.)

Disconnected!

- **User Name/Password** - Enter the User Name and Password provided by your ISP. These fields are case-sensitive.
- **Auth Server** - Enter the authenticating server IP address or host name.
- **Auth Domain** - Type in the domain suffix server name based on your location.
 e.g.
 NSW / ACT - nsw.bigpond.net.au
 VIC / TAS / WA / SA / NT - vic.bigpond.net.au
 QLD - qld.bigpond.net.au
- **MTU Size** - The normal **MTU** (Maximum Transmission Unit) value for most Ethernet networks is 1500 Bytes. It is not recommended that you change the default **MTU Size** unless required by your ISP.
- **Connect on Demand** - In this mode, the internet connection can be terminated automatically after a specified inactivity period (**Max Idle Time**) and be re-established when you attempt to access the internet again. If you want your internet connection keeps active all the time, please enter "0" in the **Max Idle Time** field. Otherwise, enter the number of minutes you want to have elapsed before your internet access disconnects.

- **Connect Automatically** - The connection can be re-established automatically when it was down.
- **Connect Manually** - You can click the **Connect/Disconnect** button to connect/disconnect immediately. This mode also supports the **Max Idle Time** function as **Connect on Demand** mode. After a specified period of inactivity (**Max Idle Time**), the router will disconnect from your internet connection, and you will not be able to re-establish your connection automatically as soon as you attempt to access the internet again. To use this option, click the radio button. If you want your internet connection to remain active at all times, enter "0" in the **Max Idle Time** field. Otherwise, enter the number in minutes that you wish to have the internet connecting last unless a new link is requested.

Click the **Connect** button to connect immediately. Click the **Disconnect** button to disconnect immediately.

Caution: Sometimes the connection cannot be terminated although you specify a time to Max Idle Time because some applications are visiting the internet continually in the background.

Click the **Save** button to make the settings effective.

5. If your ISP provides L2TP connection, please select **L2TP/Russia L2TP**. And you should enter the following parameters:

WAN

WAN Connection Type:

User Name:

Password:

Confirm Password:

Disconnected!

Dynamic IP Static IP

Server IP Address/Name:

IP Address: 0.0.0.0

Subnet Mask: 0.0.0.0

Gateway: 0.0.0.0

DNS: 0.0.0.0 , 0.0.0.0

Internet IP Address: 0.0.0.0

Internet DNS: 0.0.0.0 , 0.0.0.0

MTU Size (in bytes): (The default is 1460, do not change unless necessary.)

Max Idle Time: minutes (0 means remain active at all times.)

Connection Mode: Connect on Demand
 Connect Automatically
 Connect Manually

- **User Name/Password** - Enter the User Name and Password provided by your ISP. These fields are case-sensitive.
- **Confirm Password** - Re-enter the Password provided by your ISP to ensure the Password you entered is correct.
- **Dynamic IP/ Static IP** - Select **Static IP** if IP address, subnet mask, gateway and DNS server address have been provided by your ISP. Otherwise, please select **Dynamic IP**.
- **Server IP Address/Name** - Enter server IP address or domain name provided by your ISP.
- **IP address** - Enter the IP address used for dial-up. (Only can be configured when Static IP is selected).
- **Subnet Mask** - Enter the subnet mask provided by your ISP. (Only can be configured when Static IP is selected)
- **Gateway** - Enter gateway provided by your ISP. (Only can be configured when Static IP is selected)

- **DNS** - Enter DNS server provided by your ISP. (Only can be configured when Static IP is selected)
- **Internet IP Address** - The internet IP address assigned by L2TP server.
- **Internet DNS** - The internet DNS server address assigned by L2TP server.
- **Connect on Demand** - You can configure the router to disconnect your internet connection after a specified period of the internet connectivity (Max Idle Time). If your internet connection has been terminated due to inactivity, Connect on Demand enables the router to automatically re-establish your connection as soon as you attempt to access the internet again. If you wish to activate Connect on Demand, click the radio button. If you want your internet connection to remain active at all times, enter 0 in the Max Idle Time field. Otherwise, enter the number of minutes you want to have elapsed before your internet connection terminates.
- **Connect Automatically** - Connect automatically after the router is disconnected. To use this option, click the radio button.
- **Connect Manually** - You can configure the router to make it connect or disconnect manually. After a specified period of inactivity (Max Idle Time), the router will disconnect from your internet connection, and you will not be able to re-establish your connection automatically as soon as you attempt to access the internet again. To use this option, click the radio button. If you want your internet connection to remain active at all times, enter "0" in the Max Idle Time field. Otherwise, enter the number in minutes that you wish to have the internet connecting last unless a new link is requested.

Caution: Sometimes the connection cannot be disconnected although you specify a time to Max Idle Time, since some applications is visiting the internet continually in the background.

6. If your ISP provides PPTP connection, please select **PPTP/Russia PPTP**. And you should enter the following parameters:

WAN

WAN Connection Type:

User Name:

Password:

Confirm Password:

Disconnected!

Dynamic IP Static IP

Server IP Address/Name:

IP Address: 0.0.0.0

Subnet Mask: 0.0.0.0

Gateway: 0.0.0.0

DNS: 0.0.0.0 , 0.0.0.0

Internet IP Address: 0.0.0.0

Internet DNS: 0.0.0.0 , 0.0.0.0

MTU Size (in bytes): (The default is 1420, do not change unless necessary.)

Max Idle Time: minutes (0 means remain active at all times.)

Connection Mode: Connect on Demand
 Connect Automatically
 Connect Manually

- **User Name/Password** - Enter the User Name and Password provided by your ISP. These fields are case-sensitive.
- **Confirm Password** - Re-enter the Password provided by your ISP to ensure the Password you entered is correct.
- **Dynamic IP/Static IP** - Select **Static IP** if IP address, subnet mask, gateway and DNS server address have been provided by your ISP. Otherwise, please select **Dynamic IP**.
- **Server IP Address/Name** - Enter server IP address or domain name provided by your ISP.
- **IP address** - Enter the IP address used for dial-up. (Only can be configured when Static IP is selected).
- **Subnet Mask** - Enter the subnet mask provided by your ISP. (Only can be configured when Static IP is selected)

- **Gateway** - Enter gateway provided by your ISP. (Only can be configured when Static IP is selected)
- **DNS** - Enter DNS server provided by your ISP. (Only can be configured when Static IP is selected)
- **Internet IP Address** - The internet IP address assigned by PPTP server.
- **Internet DNS** - The internet DNS server address assigned by PPTP server.
- **Connect on Demand** - You can configure the router to disconnect from your internet connection after a specified period of inactivity (**Max Idle Time**). If your internet connection has been terminated due to inactivity, **Connect on Demand** enables the router to automatically re-establish your connection as soon as you attempt to access the internet again. If you wish to activate **Connect on Demand**, click the radio button. If you want your internet connection to remain active at all times, enter 0 in the **Max Idle Time** field. Otherwise, enter the number of minutes you want to have elapsed before your internet connection terminates.
- **Connect Automatically** - Connect automatically after the router is disconnected. To use this option, click the radio button.
- **Connect Manually** - You can configure the router to make it connect or disconnect manually. After a specified period of inactivity (**Max Idle Time**), the router will disconnect from your internet connection, and you will not be able to re-establish your connection automatically as soon as you attempt to access the internet again. To use this option, click the radio button. If you want your internet connection to remain active at all times, enter "0" in the **Max Idle Time** field. Otherwise, enter the number in minutes that you wish to have the internet connecting last unless a new link is requested.

Caution: Sometimes the connection cannot be disconnected although you specify a time to **Max Idle Time**, since some applications are visiting the internet continually in the background.

 **Note:**

If you don't know how to choose the appropriate connection type, click **Detect** to allow the router to automatically search your internet connection for servers and protocols. The connection type will be reported when an active internet service is successfully detected by the router. This report is for your reference only. To make sure the connection type your ISP provides, please refer to the ISP. The various types of internet connections that the router can detect are as follows:

- **PPPoE** - Connections which use PPPoE that requires a user name and password.
- **Dynamic IP** - Connections which use dynamic IP address assignment.
- **Static IP** - Connections which use static IP address assignment.

The router cannot detect PPTP/L2TP/BigPond connections with your ISP. If your ISP uses one of these protocols, then you must configure your connection manually.

5.5.2 MAC Clone

Go to [Network](#) → [MAC Clone](#), and then you can configure the MAC address of the WAN:

MAC Clone

WAN MAC Address:	<input type="text" value="3C-46-D8-E0-60-C5"/>	<input type="button" value="Restore Factory MAC"/>
Your PC's MAC Address:	<input type="text" value="D4-3D-7E-BF-61-5F"/>	<input type="button" value="Clone MAC Address"/>

Some ISPs require that you register the MAC Address of your adapter. Changes are rarely needed here.

- [WAN MAC Address](#) - This field displays the current MAC address of the WAN port. If your ISP requires you to register the MAC address, please enter the correct MAC address into this field in XX-XX-XX-XX-XX-XX format (X is any hexadecimal digit).
- [Your PC's MAC Address](#) - This field displays the MAC address of the PC that is managing the router. If the MAC address is required, you can click [Clone MAC Address](#) and this MAC address will fill in the [WAN MAC Address](#) field.

Click [Restore Factory MAC](#) to restore the MAC address of WAN port to the factory default value.

Click [Save](#) to make the settings effective.

 **Note:**

Only the PC on your LAN can use the [MAC Address Clone](#) function.

5.5.3 LAN

Go to [Network](#) → [LAN](#), and then you can configure the IP parameters of the LAN on the screen as below.

- **MAC Address** - The physical address of the router, as seen from the LAN. The value can't be changed.
- **IP Address** - Enter the IP address of your Router or reset it in dotted-decimal notation (factory default: 192.168.1.1).
- **Subnet Mask** - An address code that determines the size of the network. Normally use 255.255.255.0 as the subnet mask.
- **IGMP Proxy** - If you want to watch TV through IGMP, please Enable it.

Note:

- 1) If you change the IP Address of LAN, you must use the new IP Address to log in to the router.
- 2) If the new LAN IP Address you set is not in the same subnet, the IP Address pool of the DHCP server will change accordingly at the same time, while the Virtual Server and DMZ Host will not take effect until they are re-configured.

Click **Save** to make the settings effective.

5.5.4 VLAN

Go to **Network** → **VLAN**, You can configure the VLAN parameters for different application on this page.

- **VLAN Enable** - Configure the function according to your ISP, otherwise the internet could

not be accessed. If "NO" is selected, the other options would be invalid.

- **Internet VLAN ID** - Tick the TAG checkbox if your ISP need internet VLAN. Enter the VLAN ID for internet access, which is provided by your ISP. Only the correct VLAN ID can make internet access successfully. If your ISP doesn't need internet VLAN, you should untick the TAG checkbox and then the internet VLAN ID option would become invalid.
- **Internet VLAN Pri** - Select the priority of internet VLAN. Keep it as default unless necessary. When you untick the TAG checkbox beside internet VLAN ID, the internet VLAN Pri option would become invalid.
- **IPTV VLAN ID** - Enter the VLAN ID for IPTV access, which is provided by your ISP. Only the correct VLAN ID can make IPTV access successfully.
- **IPTV VLAN Pri** - Select the priority of IPTV VLAN. Keep it as default unless necessary.
- **IP-Phone VLAN ID** - Enter the VLAN ID for IP-phone, which is provided by your ISP. Only the correct VLAN ID can make IP-phone service successfully.
- **IP-Phone VLAN Pri** - Select the priority of IP-phone. Keep it as default unless necessary.
- **LAN1 Mode** - LAN1 is worked on internet mode, which means you can use LAN1 to access internet and manage the router.
- **LAN1~3 Mode** - LAN1 is fixed as internet. LAN2~3 can be worked on internet mode, IPTV mode or IP-Phone mode. When it worked on internet mode, you can use it to access internet and manage the router; and when it worked on IPTV mode, you can connect the STB to the LAN port and get the IPTV service. When it worked on IP-Phone mode, you can get the VoIP service. Please check with your ISP for the service detail.

Click [Save](#) to make the settings effective.

5.6 Wireless

The configuration is similar to [Wireless](#) in 3G/4G Router mode. Please refer to [4.7 Wireless](#).

5.7 Guest Network

There are two submenus under the Guest Network menu: [Wireless Settings](#) and [Wireless Statistics](#). Click any of them, and you will be able to configure the corresponding function.

5.7.1 Wireless Settings

Go to [Guest Network](#) → [Wireless Settings](#), you can configure the basic settings for the Guest network on this page.

Guest Network Wireless Settings

Access And Bandwidth Control

Allow Guest To Access My Local Network:

Enable Guest Network Bandwidth Control:

Egress Bandwidth For Guest Network: Kbps **(Range:1~100000)**

Ingress Bandwidth For Guest Network: Kbps **(Range:1~100000)**

Wireless

Guest Network:

Network Name: (Also called the SSID)

Wireless Security:

Access Time: can not be connected.

Everyday Select Days

Mon Tue Wed Thu Fri Sat Sun

All day-24 Hours

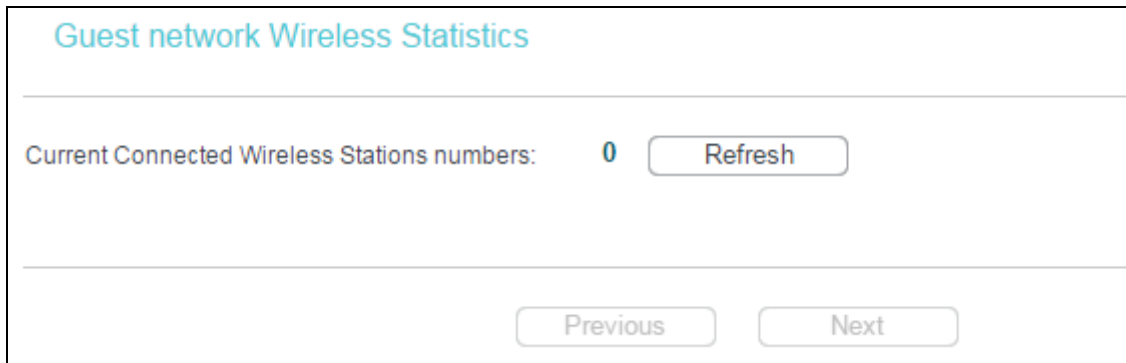

Start Time: (HHMM)

End Time: (HHMM)

- [Allow Guest To Access My Local Network](#) - If enabled, guests can communicate with hosts.
- [Enable Guest Network Bandwidth Control](#) - If enabled, the Guest Network Bandwidth Control rules will take effect.
- [Egress Bandwidth For Guest Network](#) - The upload speed through the WAN port for Guest Network.
- [Ingress Bandwidth For Guest Network](#) - The download speed through the WAN port for Guest Network.
- [Guest Network](#) - Enabled or disable the Guest Network function here.
- [Network Name](#) - Enter a value of up to 32 characters. The same Name (SSID) must be assigned to all wireless devices in your Guest Network.
- [Wireless Security](#) - You can configure the security of Guest Network here.
- [Access Time](#) - During the time the wireless stations could accessing the router.

5.7.2 Wireless Statistics

Go to [Guest Network](#) → [Wireless Statistics](#), and then you can see the MAC Address, Current Status, Received Packets and Sent Packets for each connected wireless station.

- [MAC Address](#) - The connected wireless station's MAC address.
- [Current Status](#) - The connected wireless station's running status, one of [STA-AUTH](#) / [STA-ASSOC](#) / [STA-JOINED](#) / [WPA](#) / [WPA-PSK](#) / [WPA2](#) / [WPA2-PSK](#) / [AP-UP](#) / [AP-DOWN](#) / [Disconnected](#).
- [Received Packets](#) - Packets received by the station.
- [Sent Packets](#) - Packets sent by the station.
- [Configure](#) - The button is used for loading the item to the Wireless MAC Filtering list.
 - [Deny](#): if the Wireless MAC Filtering function enable, deny the station to access.
 - [Allow](#): if the Wireless MAC Filtering function enable, allow the station to access.

You cannot change any of the values on this page. To update this page and to show the current connected wireless stations, click [Refresh](#).

If the numbers of connected wireless stations go beyond one page, click [Next](#) to go to the next page and click [Previous](#) to return to the previous page.

 **Note:**

This page will be refreshed automatically every 5 seconds.

5.8 DHCP

The configuration is similar to [DHCP](#) in 3G/4G Router mode. Please refer to [4.9 DHCP](#).

5.9 Forwarding

The configuration is similar to [Fowarding](#) in 3G/4G Router mode. Please refer to [4.10 Forwarding](#).

5.10 Security

There are four submenus under the Security menu: [Basic Security](#), [Advanced Security](#), [Local Management](#) and [Remote Management](#). Click any of them, and you will be able to configure the corresponding function.

5.10.1 Basic Security

Go to [Security](#) → [Basic Security](#), and then you can configure the basic security in the screen as shown below.

 A screenshot of the 'Basic Security' configuration page. The page is divided into three sections: Firewall, VPN, and ALG. Each section contains several settings with radio buttons for 'Enable' and 'Disable'.

Section	Setting	Enable	Disable
Firewall	SPI Firewall:	<input checked="" type="radio"/>	<input type="radio"/>
VPN	PPTP Passthrough:	<input checked="" type="radio"/>	<input type="radio"/>
	L2TP Passthrough:	<input checked="" type="radio"/>	<input type="radio"/>
	IPSec Passthrough:	<input checked="" type="radio"/>	<input type="radio"/>
ALG	FTP ALG:	<input checked="" type="radio"/>	<input type="radio"/>
	TFTP ALG:	<input checked="" type="radio"/>	<input type="radio"/>
	H323 ALG:	<input checked="" type="radio"/>	<input type="radio"/>
	RTSP ALG:	<input checked="" type="radio"/>	<input type="radio"/>
	SIP ALG:	<input checked="" type="radio"/>	<input type="radio"/>

- [Firewall](#) - A firewall protects your network from the outside world. Here you can enable or disable the router's firewall.
 - [SPI Firewall](#) - SPI (Stateful Packet Inspection, also known as dynamic packet filtering) helps to prevent cyber attacks by tracking more state per session. It validates that the traffic passing through the session conforms to the protocol. SPI Firewall is enabled by factory default. If you want all the computers on the LAN exposed to the outside world, you can disable it.

- **VPN** - VPN Passthrough must be enabled if you want to allow VPN tunnels using VPN protocols to pass through the router.
 - **PPTP Passthrough** - Point-to-Point Tunneling Protocol (PPTP) allows the Point-to-Point Protocol (PPP) to be tunneled through an IP network. To allow PPTP tunnels to pass through the router, click [Enable](#).
 - **L2TP Passthrough** - Layer Two Tunneling Protocol (L2TP) is the method used to enable Point-to-Point sessions via the internet on the Layer Two level. To allow L2TP tunnels to pass through the router, click [Enable](#).
 - **IPSec Passthrough** - Internet Protocol security (IPSec) is a suite of protocols for ensuring private, secure communications over Internet Protocol (IP) networks, through the use of cryptographic security services. To allow IPSec tunnels to pass through the router, click [Enable](#).

- **ALG** - It is recommended to enable Application Layer Gateway (ALG) because ALG allows customized Network Address Translation (NAT) traversal filters to be plugged into the gateway to support address and port translation for certain application layer "control/data" protocols such as FTP, TFTP, H323 etc.
 - **FTP ALG** - To allow FTP clients and servers to transfer data across NAT, click [Enable](#).
 - **TFTP ALG** - To allow TFTP clients and servers to transfer data across NAT, click [Enable](#).
 - **H323 ALG** - To allow Microsoft NetMeeting clients to communicate across NAT, click [Enable](#).
 - **RTSP ALG** - To allow some media player clients to communicate with some streaming media servers across NAT, click [Enable](#).
 - **SIP ALG** - To allow some multimedia clients to communicate across NAT, click [Enable](#).

Click [Save](#) to make the settings effective.

5.10.2 Advanced Security

Go to [Security](#) → [Advanced Security](#), and then you can protect the router from being attacked by TCP-SYN Flood, UDP Flood and ICMP-Flood in the screen as shown below.

Advanced Security

Packets Statistics Interval (5 ~ 60): Seconds

DoS Protection: Disable Enable

Enable ICMP-FLOOD Attack Filtering

ICMP-FLOOD Packets Threshold (5 ~ 3600): Packets/Secs

Enable UDP-FLOOD Filtering

UDP-FLOOD Packets Threshold (5 ~ 3600): Packets/Secs

Enable TCP-SYN-FLOOD Attack Filtering

TCP-SYN-FLOOD Packets Threshold (5 ~ 3600): Packets/Secs

Ignore Ping Packet from WAN Port to Router

Forbid Ping Packet from LAN Port to Router

- **Packets Statistics Interval (5~60)** - The default value is 10. Select a value between 5 and 60 seconds from the drop-down list. The Packets Statistics Interval value indicates the time section of the packets statistics. The result of the statistics is used for analysis by SYN Flood, UDP Flood and ICMP-Flood.
- **DoS Protection** - Denial of Service protection. Check the Enable or Disable button to enable or disable the DoS protection function. Only when it is enabled, will the flood filters be enabled.

 **Note:**

Dos Protection will take effect only when the **Current Statistics Status** in **System Tools** → **Statistics** is enabled.

- **Enable ICMP-FLOOD Attack Filtering** - Enable or Disable the ICMP-FLOOD Attack Filtering.
- **ICMP-FLOOD Packets Threshold (5~3600)** - The default value is 50. Enter a value between 5 ~ 3600. When the current ICMP-FLOOD Packets number is beyond the set value, the router will startup the blocking function immediately.
- **Enable UDP-FLOOD Filtering** - Enable or Disable the UDP-FLOOD Filtering.

- **UDP-FLOOD Packets Threshold (5~3600)** - The default value is 500. Enter a value between 5 ~ 3600. When the current UPD-FLOOD Packets number is beyond the set value, the router will startup the blocking function immediately.
- **Enable TCP-SYN-FLOOD Attack Filtering** - Enable or Disable the TCP-SYN-FLOOD Attack Filtering.
- **TCP-SYN-FLOOD Packets Threshold (5~3600)** - The default value is 50. Enter a value between 5 ~ 3600. When the current TCP-SYN-FLOOD Packets numbers is beyond the set value, the router will startup the blocking function immediately.
- **Ignore Ping Packet from WAN Port to Router** - Enable or Disable Ignore Ping Packet from WAN Port to Router. The default setting is disabled. If enabled, the ping packet from internet cannot access the Router.
- **Forbid Ping Packet from LAN Port to Router** - Enable or Disable Forbid Ping Packet from LAN Port to Router. The default setting is disabled. If enabled, the ping packet from LAN cannot access the Router. (Defends against some viruses).

Click [Save](#) to make the settings effective.

Click [Blocked DoS Host List](#) to display the DoS host table by blocking.

5.10.3 Local Management

Go to [Security](#) → [Local Management](#), and then you can configure the management rule in the screen as shown below. The management feature allows you to deny computers in LAN from accessing the router.

Local Management

Management Rules

All the PCs on the LAN are allowed to access the Router's Web-Based Utility
 Only the PCs listed can browse the built-in web pages to perform Administrator tasks

MAC 1:

MAC 2:

MAC 3:

MAC 4:

Your PC's MAC Address:

By default, the radio button “All the PCs on the LAN are allowed to access the Router's Web-Based Utility” is checked. If you want to allow PCs with specific MAC Addresses to access the Setup page of the router's Web-Based Utility locally from inside the network, check the radio button “Only the PCs listed can browse the built-in web pages to perform Administrator tasks”,

and then enter each MAC Address in a separate field. The format for the MAC Address is XX-XX-XX-XX-XX-XX (X is any hexadecimal digit). Only the PCs with MAC address listed can use the password to browse the built-in web pages to perform Administrator tasks while all the others will be blocked.

After click [Add](#), your PC's MAC Address will be placed in the list above.

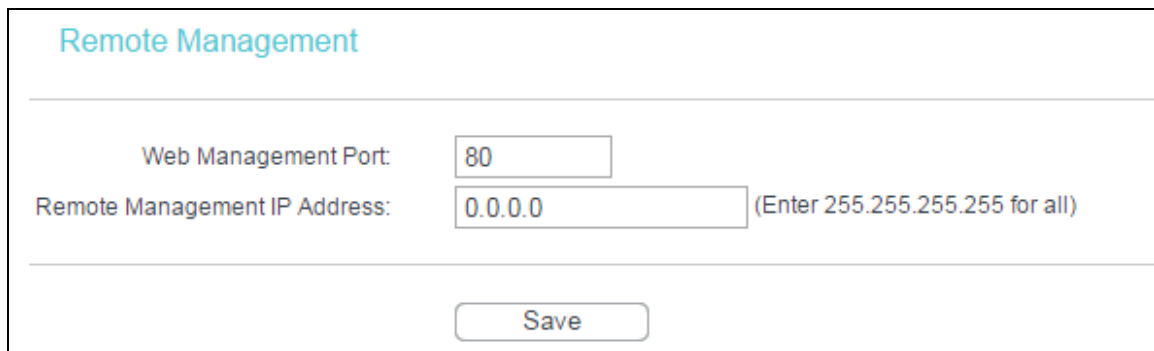

Click [Save](#) to make the settings effective.

 **Note:**

If your PC is blocked but you want to access the router again, press and hold down the WPS/RESET button on the rear panel of the router until the Power LED starts flashing to reset the router's factory defaults in the router's web management page.

5.10.4 Remote Management

Go to [Security](#) → [Remote Management](#), and then you can configure the Remote Management function in the screen as shown below. This feature allows you to manage your router from a remote location via the internet.

The screenshot shows the 'Remote Management' configuration interface. It has a title bar 'Remote Management'. Below it, there are two rows of configuration options. The first row is 'Web Management Port' with a text box containing '80'. The second row is 'Remote Management IP Address' with a text box containing '0.0.0.0' and a note '(Enter 255.255.255.255 for all)'. At the bottom center, there is a 'Save' button.

- **Web Management Port** - Web browser access normally uses the standard HTTP service port 80. This Router's default remote management web port number is 80. For greater security, you can change the remote management web port to a custom port by entering that number in the box provided. Choose a number between 1 and 65534 but do not use the number of any common service port.
- **Remote Management IP Address** - This is the current address you will use when accessing your Router from the internet. This function is disabled when the IP address is set to the default value of 0.0.0.0. To enable this function change 0.0.0.0 to a valid IP address. If set to 255.255.255.255, then all the hosts can access the router from internet.

 **Note:**

- 1) To access the router, you should type your Router's WAN IP address into your browser's address (in IE) or Location (in Navigator) box, followed by a colon and the custom port number. For example, if your Router's WAN address is 202.96.12.8, and the port number used is 8080, please enter `http://202.96.12.8:8080` in your browser. Later, you may be asked for the router's password. After successfully entering the username and password, you will be able to access the router's web management page.

- 2) Be sure to change the router's default password to a very secure password.

5.11 Parental Control

The configuration is similar to [Parental Control](#) in 3G/4G Router mode. Please refer to [4.12 Parental Control](#).

5.12 Access Control

The configuration is similar to [Access Control](#) in 3G/4G Router mode. Please refer to [4.13 Access Control](#).

5.13 Advanced Routing

The configuration is similar to [Advanced Routing](#) in 3G/4G Router mode. Please refer to [4.14 Advanced Routing](#).

5.14 Bandwidth Control

There are two submenus under the Bandwidth Control menu: [Control Settings](#) and [Rule List](#). Click any of them, and you will be able to configure the corresponding function. The detailed explanations for each submenu are provided below.

5.14.1 Control Settings

Go to [Bandwidth Control](#) → [Control Settings](#), and then you can configure the Egress Bandwidth and Ingress Bandwidth in the next screen. For optimal control of the bandwidth, please select the right Line Type and ask your ISP for the total bandwidth of the egress and ingress.

 A screenshot of the 'Bandwidth Control Settings' configuration page. The title is 'Bandwidth Control Settings'. There are four main settings:

- 'Enable Bandwidth Control:' with an unchecked checkbox.
- 'Line Type:' with two radio buttons: 'ADSL' (selected) and 'Other'.
- 'Egress Bandwidth:' with a text input field containing '512' and the unit 'Kbps' to its right.
- 'Ingress Bandwidth:' with a text input field containing '2048' and the unit 'Kbps' to its right.

 At the bottom center, there is a 'Save' button.

- [Enable Bandwidth Control](#) - Select this box so that the Bandwidth Control settings can take effect.

- [Line Type](#) - Select the right type for you network connection. If you don't know how to choose, please ask your ISP for the information.
- [Egress Bandwidth](#) - The upload speed through the WAN port.
- [Ingress Bandwidth](#) - The download speed through the WAN port.

5.14.2 Rule List

Go to [Bandwidth Control](#) → [Rule List](#), and then you can view and configure the Bandwidth Control rules in the screen below.

Bandwidth Control Rule List							
ID	Description	Egress Bandwidth(Kbps)		Ingress Bandwidth(Kbps)		Enable	Modify
		Min	Max	Min	Max		
The current list is empty.							
Add New...		Delete All					
Previous		Next		Current No. <input type="text" value="1"/> Page			

- [Description](#) - The information of description include address range, the port range and protocol of transport layer.
- [Egress Bandwidth](#) - The max upload speed which through the WAN port, default number is 0.
- [Ingress Bandwidth](#) - The max download speed which through the WAN port, default number is 0.
- [Enable](#) - Rule status, show whether the rule takes effect.
- [Modify](#) - Click [Modify](#) to edit the rule. Click [Delete](#) to delete the rule.

To add/modify a Bandwidth Control rule, follow the steps below.

1. Click [Add New...](#), you will see a new screen as shown below.
2. Enter the information like the screen shown below.

Bandwidth Control Rule Settings

Enable:	<input checked="" type="checkbox"/>		
IP Range:	<input style="width: 150px;" type="text" value="192.168.1.1"/>	-	<input style="width: 150px;" type="text" value="192.168.1.23"/>
Port Range:	<input style="width: 80px;" type="text" value="21"/>	-	<input style="width: 80px;" type="text"/>
Protocol:	<input style="width: 100px; border: 1px solid #ccc;" type="text" value="All"/> ▼		
	Min Bandwidth(Kbps)		Max Bandwidth(Kbps)
Egress Bandwidth:	<input style="width: 150px;" type="text" value="0"/>		<input style="width: 150px;" type="text" value="0"/>
Ingress Bandwidth:	<input style="width: 150px;" type="text" value="0"/>		<input style="width: 150px;" type="text" value="0"/>

3. Click [Save](#).

5.15 IP & MAC Binding

The configuration is similar to [IP & MAC Binding Setting](#) in 3G/4G Router mode. Please refer to [4.15 IP & MAC Binding](#).

5.16 Dynamic DNS

The configuration is similar to [Dynamic DNS](#) in 3G/4G Router mode. Please refer to [4.16 Dynamic DNS](#).

5.17 IPv6 Support

Choose menu [IPv6 Support](#), and you can see the submenus under the main menu: [IPv6 Status](#), [IPv6 Setup](#). Click any of them, and you will be able to configure the corresponding function. The detailed explanations for each submenu are provided below.

5.17.1 IPv6 Status

The IPv6 Status page displays the router's current IPv6 status and configuration. All information is read-only.

IPv6 Status	
WAN	
Connection Type:	Disabled
IPv6 Address:	
IPv6 Default Gateway:	
Primary IPv6 DNS:	
Secondary IPv6 DNS:	
LAN	
IPv6 Address Assign Type:	RADVD
IPv6 Address:	
Link-local Address:	/0

WAN

- **Connection Type** - The IPv6 connection way for WAN.
- **IPv6 Address** - The WAN IPv6 address.
- **IPv6 Default Gateway** - The router's default gateway.
- **Primary IPv6 DNS** - The primary IPv6 DNS address.
- **Secondary IPv6 DNS** - The secondary IPv6 DNS address.

LAN

- **IPv6 Address Assign Type** - The way how the router assign IPv6 address for PC in LAN, RADVD (Router Advertisement Daemon) and DHCPv6 (Dynamic Host Configuration Protocol for IPv6) Server.
- **IPv6 Address** - The LAN global IPv6 address of the router
- **Link-local Address** - The LAN Link-local Address of the router.

5.17.2 IPv6 Setup

Go to [IPv6 Support](#) → [IPv6 Setup](#), and then you can set up IPv6 service on the following screen.

WAN Setup

Enable IPv6:

WAN Connection Type: PPPoEv6 ▼

PPPoE Session: Share with PPPoEv4 Create a new Session

Username:

Password:

Confirm Password:

IPv6 Address:

IPv6 Address Prefix:

Default Gateway:

MTU: 1492 Bytes, 1492 as default, do not change unless necessary.

Get IPv6 DNS Server Automatically

Primary IPv6 DNS:

Secondary IPv6 DNS:

Use the following IPv6 DNS Servers

Connection Mode: Always On Connect Manual

Connect
Disconnect
Disconnected!

LAN Setup

Address Autoconfiguration Type: RADVD DHCPv6 Server

Site Prefix Configuration Type: Delegated Static

Lan IPv6 Address:

Save

To set up IPv6 service, please follow the steps below.

1. Please make sure that [Enable IPv6](#) has been checked.
2. To Configure WAN Connection Type, if you are not sure what the connection type is, please contact your IPv6 provider. Here takes PPPoEv6 as an example. After the PPPoEv6 is selected, please input the Username and Password provided by the IPv6 Provider.
3. For LAN Setup, keep the default settings as shown above. The Address Autoconfiguration Type chooses RADVD; the Site Prefix Configuration Type chooses Delegated.
4. Click [Save](#).

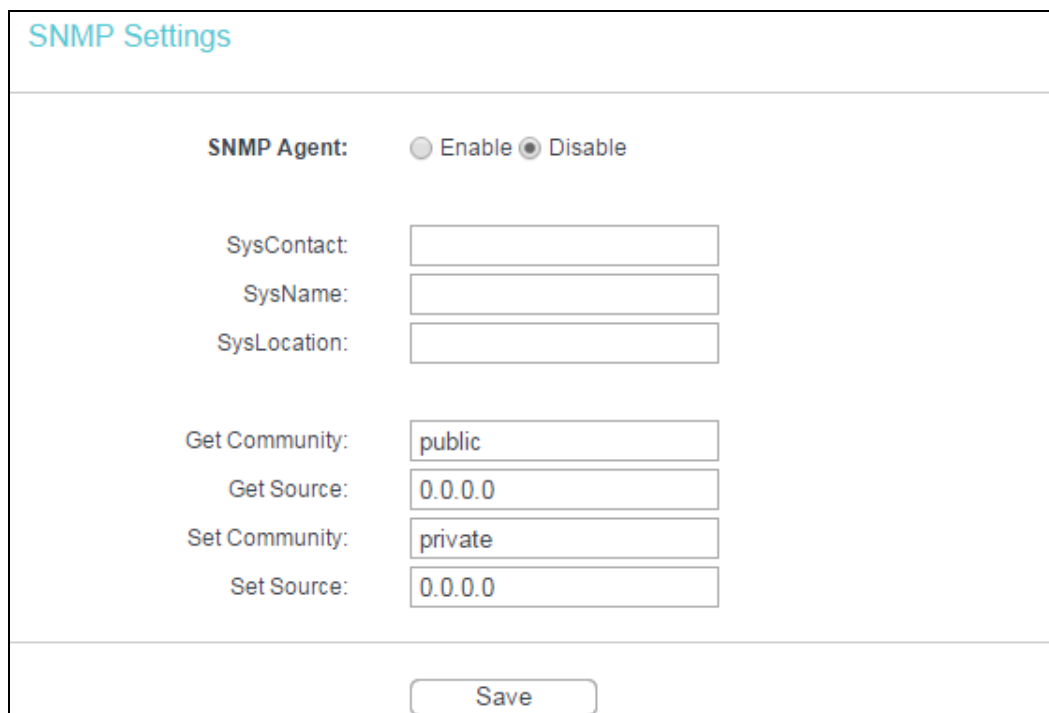

5.18 System Tools

Choose menu [System Tools](#), and you can see the submenus under the main menu: [SNMP](#), [Time Settings](#), [Diagnostic](#), [Firmware Upgrade](#), [Factory Defaults](#), [Backup & Restore](#), [Reboot](#), [TR069](#), [Password](#), [System Log](#) and [Statistics](#). Click any of them, and you will be able to configure the corresponding function. The detailed explanations for each submenu are provided below.

5.18.1 SNMP

Simple Network Management Protocol (SNMP) is a popular network monitoring and management protocol.

A screenshot of the "SNMP Settings" configuration page. The page has a title "SNMP Settings" in blue. Below the title, there is a section for "SNMP Agent" with two radio buttons: "Enable" (unselected) and "Disable" (selected). Below this, there are three input fields: "SysContact", "SysName", and "SysLocation". Further down, there are six input fields arranged in three pairs: "Get Community" (value: public), "Get Source" (value: 0.0.0.0), "Set Community" (value: private), and "Set Source" (value: 0.0.0.0). At the bottom of the page, there is a "Save" button.

- **SNMP Agent** - Choose **Enable** to open this function if you want to have remote control through SNMPv1/v2 agent with MIB-II. Choose **Disable** to close this function.
- **SysContact** - The textual identification of the contact person for this managed node.
- **SysName** - An administratively-assigned name for this managed node.
- **SysLocation** - The physical location of this node.

 **Note:**

Specifying one of these values via the Device's web management page makes the corresponding object read-only. If there isn't such a config setting, then the write request will succeed (assuming suitable access control settings), but the new value would be forgotten the next time the agent was restarted.

- **Get Community** - Enter the community name that allows Read-Only access to this device's SNMP information. The community name can be considered a group password. The default setting is **public**.
- **Get Source** - Get source defines the IP address or subnet for management systems that can read information from this 'get' community device.
- **Set Community** - Enter the community name that allows Read/Write access to this device's SNMP information. The community name can be considered a group password. The default setting is **private**.
- **Set Source** - Set source defines the IP address or subnet for management systems that can control this 'set' community device.

 **Note:**

A restricted source can be a specific IP address (e.g. 10.10.10.1), or a subnet - represented as IP/BITS (e.g. 10.10.10.0/24). If an IP Address of 0.0.0.0 is specified, the agent will accept all requests under the corresponding community name.

Click **Save** to make the settings effective.

5.18.2 Time Settings

Go to **System Tools** → **Time Setting**, and then you can configure the time on the following screen.

Time Settings

Time zone:

Date: (MM/DD/YY)

Time: (HH/MM/SS)

NTP Server 1: (Optional)

NTP Server 2: (Optional)

Enable DaylightSaving

Start: 2017

End: 2017

Daylight Saving Status:

Note: Click the "GET GMT" to update the time from the internet with the pre-defined servers or entering the customized server (IP Address or Domain Name) in the above frames.

- **Time Zone** - Select your local time zone from this pull down list.
- **Date** - Enter your local date in MM/DD/YY into the right blanks.
- **Time** - Enter your local time in HH/MM/SS into the right blanks.
- **NTP Server 1 / NTP Server 2** - Enter the address or domain of the **NTP Server 1** or **NTP Server 2**, and then the router will get the time from the NTP Server preferentially. In addition, the router built-in some common NTP Servers, so it can get time automatically once it connects the internet.
- **Enable Daylight Saving** - Check the box to enable the Daylight Saving function.
- **Start** - The time to start the Daylight Saving. Select the month in the first field, the week in the second field, the day in the third field and the time in the last field.
- **End** - The time to end the Daylight Saving. Select the month in the first field, the week in the second field, the day in the third field and the time in the last field.
- **Daylight Saving Status** - Displays the status whether the Daylight Saving is in use.

To set time manually:

1. Select your local time zone.
2. Enter the **Date** in Month/Day/Year format.
3. Enter the **Time** in Hour/Minute/Second format.
4. Click **Save**.

To set time automatically:

1. Select your local time zone.
2. Enter the address or domain of the [NTP Server 1](#) or [NTP Server 2](#).
3. Click the [Get GMT](#) button to get system time from internet if you have connected to the internet.

To set up daylight saving:

1. Check the box to enable Daylight Saving.
2. Select the start time from the drop-down lists in the [Start](#) field.
3. Select the end time from the drop-down lists in the [End](#) field.
4. Click [Save](#) to make the settings effective.

	<input checked="" type="checkbox"/>	Enable DaylightSaving
Start:	2017	Mar ▼ 3rd ▼ Sun ▼ 2am ▼
End:	2017	Nov ▼ 2nd ▼ Sun ▼ 3am ▼
Daylight Saving Status:	daylight saving is down.	

 **Note:**

- 1) This setting will be used for some time-based functions such as firewall. You must specify your time zone once you log in to the router successfully, otherwise, these functions will not take effect.
- 2) The time will be lost if the router is turned off.
- 3) The router will automatically obtain GMT from the internet if it is configured accordingly.
- 4) In daylight saving configuration, start time shall be earlier than end time.

5.18.3 Diagnostic

Go to [System Tools](#) → [Diagnostic](#), you can transact Ping or Traceroute function to check connectivity of your network in the following screen.

Diagnostic Tools

Diagnostic Parameters

Diagnostic Tool: Ping Traceroute

IP Address/ Domain Name:

Ping Count: (1-50)

Ping Packet Size: (4-1472 Bytes)

Ping Timeout: (100-2000 Milliseconds)

Traceroute Max TTL: (1-30)

Diagnostic Results

This device is ready.

- **Diagnostic Tool** - Check the radio button to select one diagnostic tool.
 - **Ping** - This diagnostic tool troubleshoots connectivity, reachability, and name resolution to a given host or gateway.
 - **Traceroute** - This diagnostic tool tests the performance of a connection.

 **Note:**

You can use ping/traceroute to test both numeric IP address or domain name. If pinging/tracerouting the IP address is successful, but pinging/tracerouting the domain name is not, you might have a name resolution problem. In this case, ensure that the domain name you are specifying can be resolved by using Domain Name System (DNS) queries.

- **IP Address/Domain Name** - Enter the IP Address or Domain Name of the PC whose connection you wish to diagnose.
- **Pings Count** - Specifies the number of Echo Request messages sent. The default is 4.
- **Ping Packet Size** - Specifies the number of data bytes to be sent. The default is 64.
- **Ping Timeout** - Time to wait for a response, in milliseconds. The default is 800.
- **Traceroute Max TTL** - Set the maximum number of hops (max TTL to be reached) in the path to search for the target (destination). The default is 20.

Click [Start](#) to start the diagnostic procedure.

The [Diagnostic Results](#) page displays the result of diagnosis.

If the result is similar to the following screen, the connectivity of the internet is fine.

```

Diagnostic Results

Pinging 202.108.22.5 with 64 bytes of data:

Reply from 202.108.22.5: bytes=64 time=164 TTL=51 seq=1
Reply from 202.108.22.5: bytes=64 time=164 TTL=51 seq=2
Reply from 202.108.22.5: bytes=64 time=164 TTL=51 seq=3
Reply from 202.108.22.5: bytes=64 time=165 TTL=51 seq=4

Ping statistics for 202.108.22.5
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss)
Approximate round trip times in milliseconds:
Minimum = 164, Maximum = 165, Average = 164

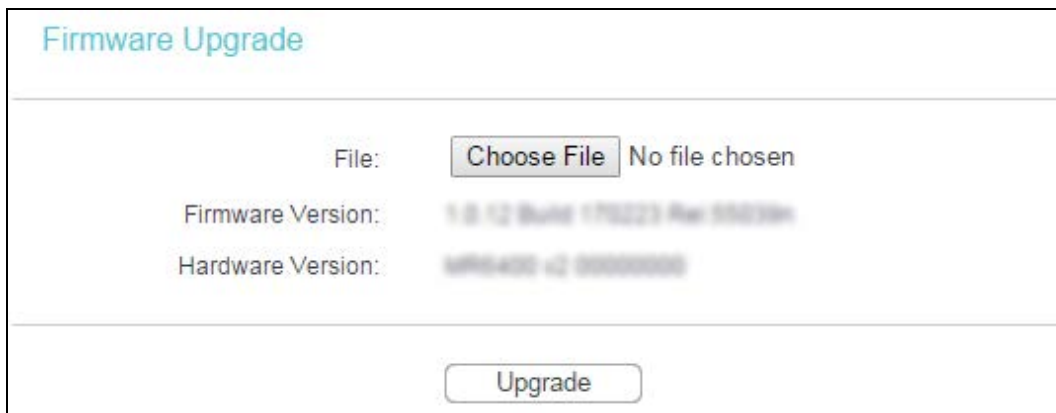

```

 **Note:**

Only one user can use this tool at one time. Options “Ping Count”, “Ping Packet Size” and “Ping Timeout” are used for [Ping](#) function. Option “Traceroute Max TTL” are used for [Tracert](#) function.

5.18.4 Firmware Upgrade

Go to [System Tools](#) → [Firmware Upgrade](#), you can update the latest version of firmware for the router on the following screen.

- [Firmware Version](#) - Displays the current firmware version.
- [Hardware Version](#) - Displays the current hardware version. The hardware version of the upgrade file must accord with the router's current hardware version.

To upgrade the router's firmware, follow these instructions below:

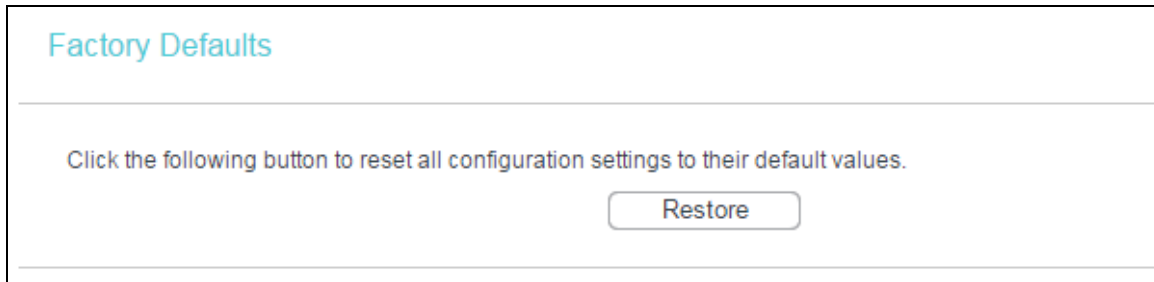

1. Download a more recent firmware upgrade file from the official website (<http://www.tp-link.com>).
2. Click [Choose File](#), then enter or select the path name where you save the downloaded file on the computer into the File Name blank.
3. Click [Upgrade](#).
4. The router will reboot while the upgrading has been finished.

Note:

The firmware version must correspond to the hardware. The upgrade process takes a few moments and this device restarts automatically when the upgrade is complete. It is important to keep power applied during the entire process. Loss of power during the upgrade could damage this device.

5.18.5 Factory Defaults

Go to [System Tools](#) → [Factory Defaults](#), and you can restore the configurations of the router to factory defaults on the following screen.

Click [Restore](#) to reset all configuration settings to their default values.

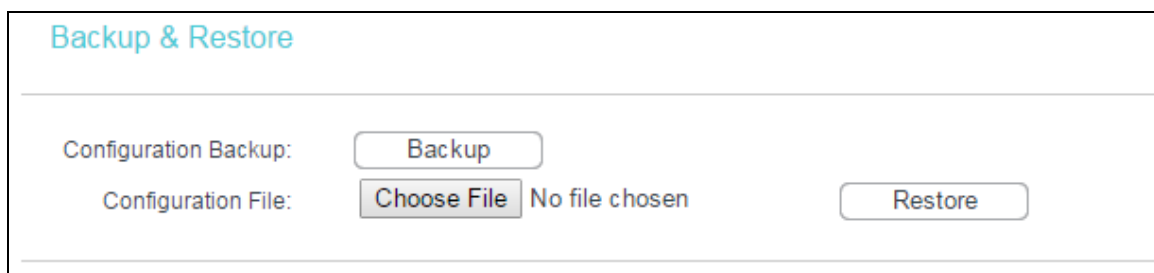

- The default [User Name](#): admin
- The default [Password](#): admin
- The default [IP Address](#): 192.168.1.1
- The default [Subnet Mask](#): 255.255.255.0

Note:

All changed settings will be lost when defaults are restored.

5.18.6 Backup & Restore

Go to [System Tools](#) → [Backup & Restore](#), you can save the current configuration of the router as a backup file and restore the configuration via a backup file.

- Click [Backup](#) to save all configuration settings to your local computer as a file.
- To restore this device's configuration, follow these instructions:
 - 3) Click [Choose File](#) to find the configuration file which you want to restore.
 - 4) Click [Restore](#) to update the configuration with the file whose path is the one you have input or selected in the blank.

Note:

The current configuration will be covered with the uploading configuration file. Wrong process will lead this device unmanaged. The restoring process lasts for 20 seconds and this device will restart automatically then. Keep the power of this device on during the process, in case of any damage.

5.18.7 Reboot

Go to [System Tools](#) → [Reboot](#), you can click [Reboot](#) to reboot the router.

Some settings of the router will take effect only after rebooting, which include

- Change the LAN IP Address (system will reboot automatically).
- Change the DHCP Settings.
- Change the Web Management Port.
- Upgrade the firmware of this device (system will reboot automatically).
- Restore this device's settings to the factory defaults (system will reboot automatically).
- Update the configuration with the file (system will reboot automatically).

5.18.8 TR069

TR-069 is a protocol for communication between a CPE and Auto-Configuration Server (ACS) that encompasses secure auto-configuration as well as other CPE management functions within a common framework.

TR069 Settings

TR069: Disable Enable

WAN IP Address: 192.168.0.169

ACS Login:

ACS URL:

User Name:

Password:

Inform: Disable Enable

Inform Interval: (1-3600)

CPE Login:

Connection Request User:

Connection Request Password:

Connection Port:

- **TR069** - Enable or Disable the TR069 function. If you disable this function, your router (CPE) will not automatically configured by Auto-Configuration Server (ACS).
- **ACS URL** - This field specifies the URL for your router (CPE) to connect to the ACS.
- **User Name** - This field used to authenticate your router (CPE) when making a connection to the ACS. This username is used only for HTTP-based authentication of your router (CPE).
- **Password** - The Password used to authenticate your router (CPE) when making a connection to the ACS. This password is used only for HTTP-based authentication of your router (CPE).
- **Inform** - Whether or not your router (CPE) must periodically send CPE info to Server using the Inform method call.
- **Inform Interval** - The duration in seconds of the interval for which your router (CPE) MUST attempt to connect with the ACS and call the Inform method if PeriodicInform-Enable is true.
- **Connection Request User/Password** - Enter the username/password for the ACS server to log in to the router.

- [Connection Port](#) - Connection request server port, for an ACS to make a connection request notification to your router (CPE).

5.18.9 Password

Go to [System Tools](#) → [Password](#), you can change the factory default user name and password of the router in the next screen.

Password

Username and password can contain between 1 - 15 characters and may not include spaces.

Old User Name:

Old Password:

New User Name:

New Password:

Confirm New Password:

It is strongly recommended that you change the factory default user name and password of this device. All users who try to access this device's web management page will be prompted for this device's user name and password.

Note:

The new user name and password must not exceed 15 characters in length and must not include any spaces. Enter the new Password twice to confirm it.

Click [Save](#) to make the settings effective.

Click [Clear All](#) to clear all.

5.18.10 System Log

Go to [System Tools](#) → [System Log](#), you can view the logs of the router.

System Log

Auto Mail Feature: **Disabled**

Log Type: Log Level:

Index	Time	Type	Level	Log Content
1	1st day 00:46:09	OTHER	INFO	User clear system log.

Time = 2017-01-01 0:46:17 2779s
H-Ver = MR6400 v2 00000000 : S-Ver = 1.0.12 Build 170223 Rel.55039n
L = 192.168.1.1 : M = 255.255.255.0
W1 = DHCP : W = 192.168.0.169 : M = 255.255.255.0 : G = 192.168.0.1

Current No. Page

- [Auto Mail Feature](#) - Indicates whether auto mail feature is enabled or not.
- [Mail Settings](#) - Set the receiving and sending mailbox address, server address, validation information as well as the timetable for Auto Mail Feature.
- [Log Type](#) - By selecting the log type, only logs of this type will be shown.
- [Log Level](#) - By selecting the log level, only logs of this level will be shown.
- [Refresh](#) - Refresh the page to show the latest log list.
- [Save Log](#) - Click to save all the logs in a txt file.
- [Mail Log](#) - Click to send an email of current logs manually according to the address and validation information set in Mail Settings. The result will be shown in the later log soon.
- [Clear Log](#) - All the logs will be deleted from this device permanently, not just from the page.

Click [Next](#) to go to the next page, or click [Previous](#) return to the previous page.

5.18.11 Statistics

Go to [System Tools](#) → [Statistics](#), and then you can view the statistics of the router, including total traffic and current traffic of the last Packets Statistic Interval.

Statistics

Current Statistics Status: **Disabled** [Enable](#)

Packets Statistics Interval(5-60): Seconds [Refresh](#)

Auto-refresh

Sorted Rules: [Reset All](#) [Delete All](#)

IP Address/ MAC Address	Total		Current			Modify
	Packets	Bytes	Packets	Bytes	ICMP Tx	
The current list is empty.						

entries per page. Current No. Page

[Previous](#) [Next](#)

- **Current Statistics Status** - Enable or Disable. The default value is disabled. To enable it, click the [Enable](#) button. If it is disabled, the function of DoS protection in Security settings will be disabled.
- **Packets Statistics Interval (5-60)** - The default value is 10. Select a value between 5 and 60 seconds in the drop-down list. The Packets Statistics interval indicates the time section of the packets statistic.
- **Sorted Rules** - Choose how the displayed statistics are sorted.

Select the [Auto-refresh](#) checkbox to refresh automatically.

Click [Refresh](#) to refresh immediately.

Click [Reset All](#) to reset the values of all the entries to zero.

Click [Delete All](#) to delete all entries in the table.

Statistics Table:

IP/MAC Address		The IP and MAC address are displayed with related statistics.
Total	Packets	The total number of packets received and transmitted by the router.
	Bytes	The total number of bytes received and transmitted by the router.
Current	Packets	The total number of packets received and transmitted in the last Packets Statistic interval seconds.
	Bytes	The total number of bytes received and transmitted in the last Packets Statistic interval seconds.
	ICMP Tx	The number of the ICMP packets transmitted to WAN per second at the specified Packets Statistics interval. It is shown like "current transmitting rate / Max transmitting rate".
	UDP Tx	The number of UDP packets transmitted to the WAN per second at the specified Packets Statistics interval. It is shown like "current transmitting rate / Max transmitting rate".
	SYN Tx	The number of SYN packets transmitted to the WAN per second at the specified Packets Statistics interval. It is shown like "current transmitting rate / Max transmitting rate".
Modify	Reset	Reset the value of the entry to zero.
	Delete	Delete the existing entry in the table.

There would be 5 entries on each page. Click [Previous](#) to return to the previous page and [Next](#) to the next page.

Appendix A: FAQ

1. What should I do if I cannot access the web management page?

- A1. If the computer is set to a static IP address, change its settings to obtain an IP address automatically.
- A2. Make sure <http://tplinkmodem.net> or <http://192.168.1.1> is correctly entered in the web browser.
- A3. Use another web browser and try again.
- A4. Reboot your router and try again.
- A5. Disable and enable the active network adapter in use.

2. What can I do if I cannot access the internet?

- A1. Verify that your SIM card is an LTE, WCDMA or GSM card.
- A2. Verify that your SIM card is in your internet service provider's service area.
- A3. Verify that your SIM card has sufficient credit.
- A4. Check the LAN connection:

Open a web browser and enter <http://tplinkmodem.net> or <http://192.168.1.1> in the address bar. If the login page does not appear, refer to FAQ > Q1 and then try again.
- A5. Check your ISP parameters:
 - 1) Open a web browser and log in to the web management page.
 - 2) Go to **Network > LTE Dial Up** to verify the parameters (including the APN, Username and Password) provided by your ISP are correctly entered. If the parameters are incorrect, click **Create** and enter the correct parameters, then select the new profile from the Profile Name list.
- A6. Check the PIN settings:
 - 1) Open a web browser and log in to the web management page.
 - 2) Go to **Network > PIN Management** to verify if PIN is required. If it is, enter the correct PIN provided by your ISP, and click **Apply**.
- A7. Check the Data Limit:
 - 1) Open a web browser and log in to the web management page.

- 2) Go to [Network > LTE Data Settings](#) to verify if the [Total/Monthly Used](#) exceeds the [Total/Monthly Allowance](#). If it does, click [Correct](#) and set [Total/Monthly Used](#) to 0 (zero), or disable [Data Limit](#).

A8. Check the Mobile Data:

- 1) Open a web browser and log in to the web management page.
- 2) Go to [Network > LTE Dial Up](#) to verify that [Mobile Data](#) is enabled. If not, enable it to access the internet.

A9. Check the Data Roaming:

- 1) Confirm with your ISP if you are in a roaming service area. If you are, open a web browser and log into the web management page.
- 2) Go to [Network > LTE Dial Up](#) to enable the [Data Roaming](#).

3. How do I restore the router to its factory default settings?

A1. With the router powered on, press and hold the [WPS/RESET](#) button on the rear panel of the router until the Power LED starts flashing, then release the button. Wait while the router resets.

WPS/RESET Button - Press and hold until the Power LED starts flashing.

A2. Log in to the web management page of the router, and go to [System Tools > Factory Defaults](#), click [Restore](#) and wait until the reset process is complete.

4. What should I do if I forget my web management page password?

A. Refer to [FAQ > Q3](#) to reset the router and then use [admin \(all lower case\)](#) for both username and password to log in.

5. What should I do if I forget my wireless network password?

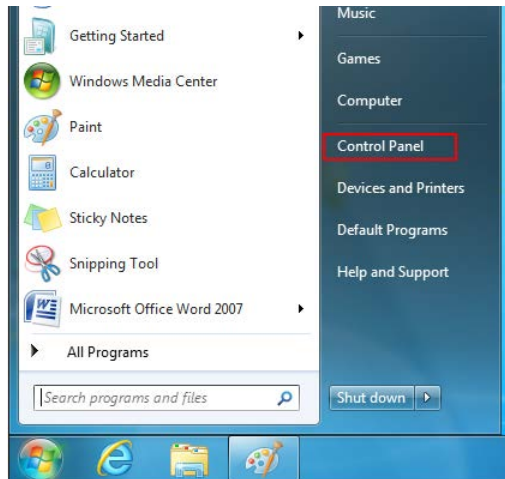

A1. The default Wireless Password is printed on the product label of the router.

A2. If the default Wireless Password has been changed, log in to the router's web management page and go to [Wireless > Wireless Security](#) to retrieve or reset your password.

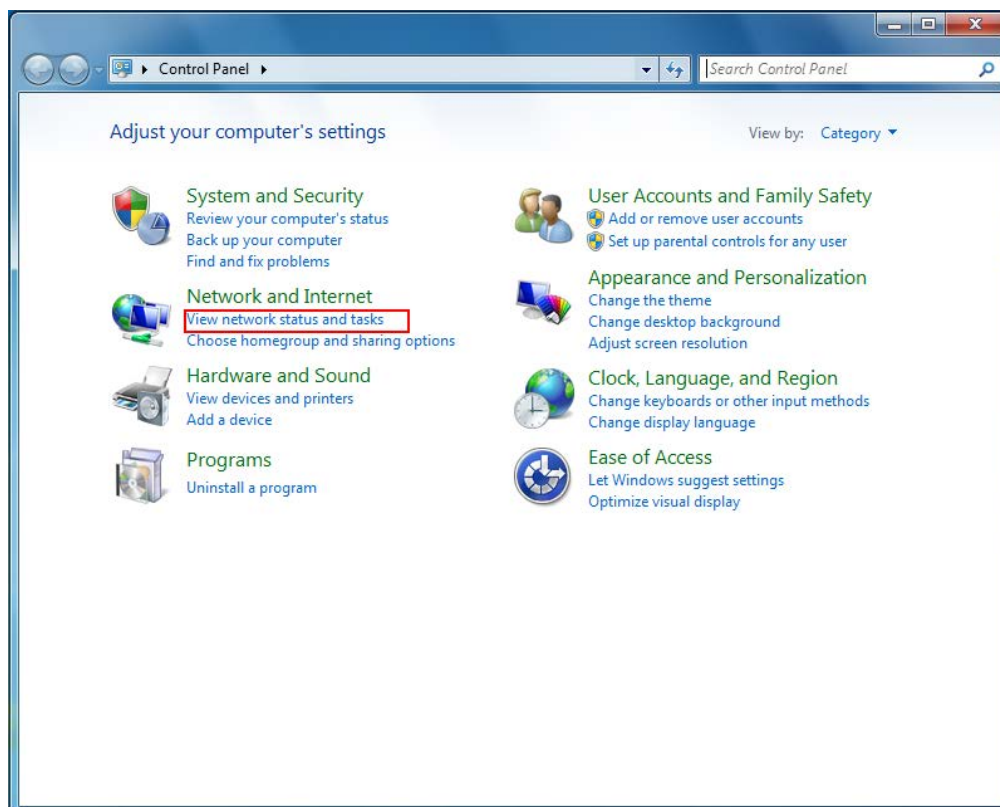

Appendix B: Configuring the PC

In this section, we'll introduce how to install and configure the TCP/IP correctly in Windows 7. First make sure your Ethernet Adapter is working, refer to the adapter's manual if needed.

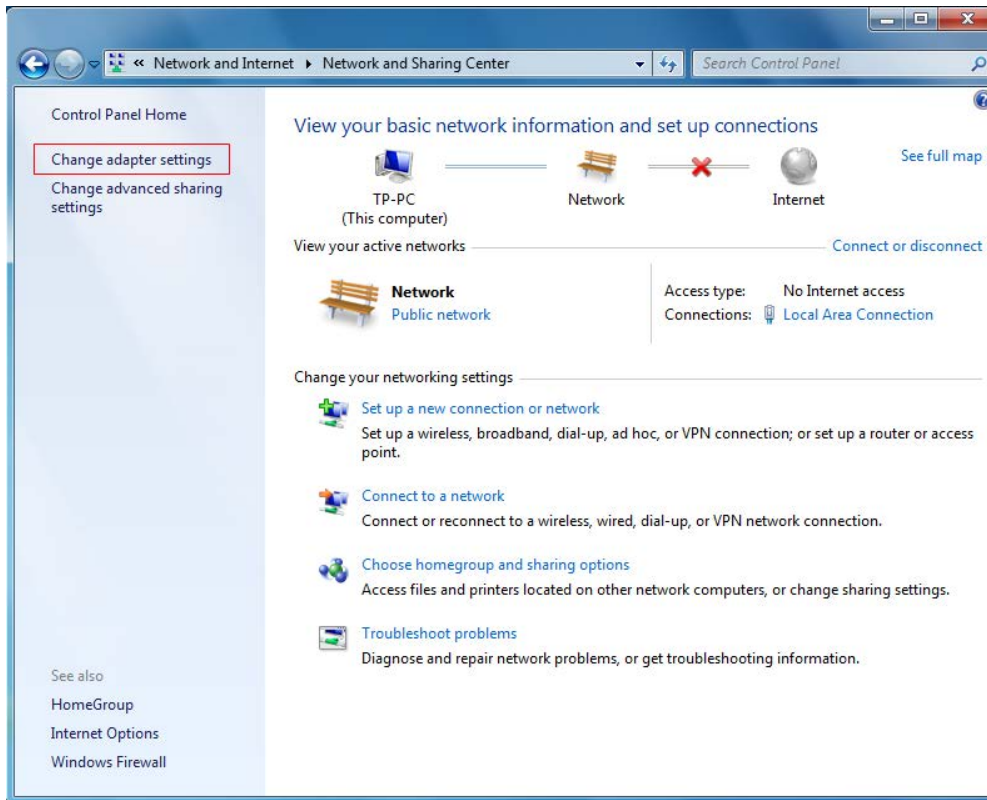

- 1) On the Windows taskbar, click the [Start](#) button, and then click [Control Panel](#).

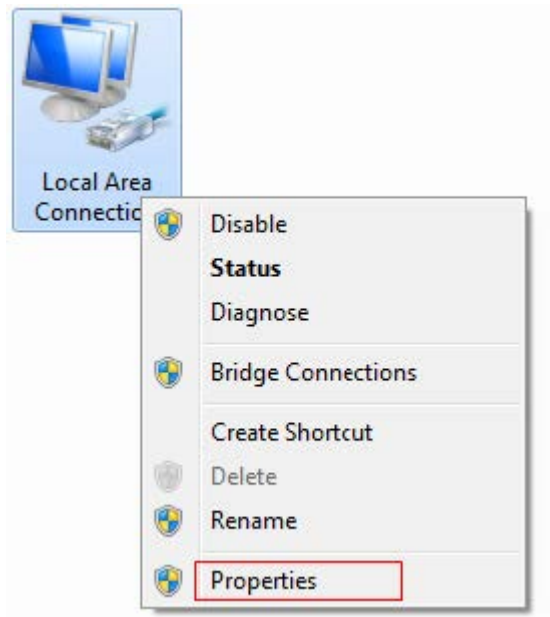

- 2) Click the [View network status and tasks](#).

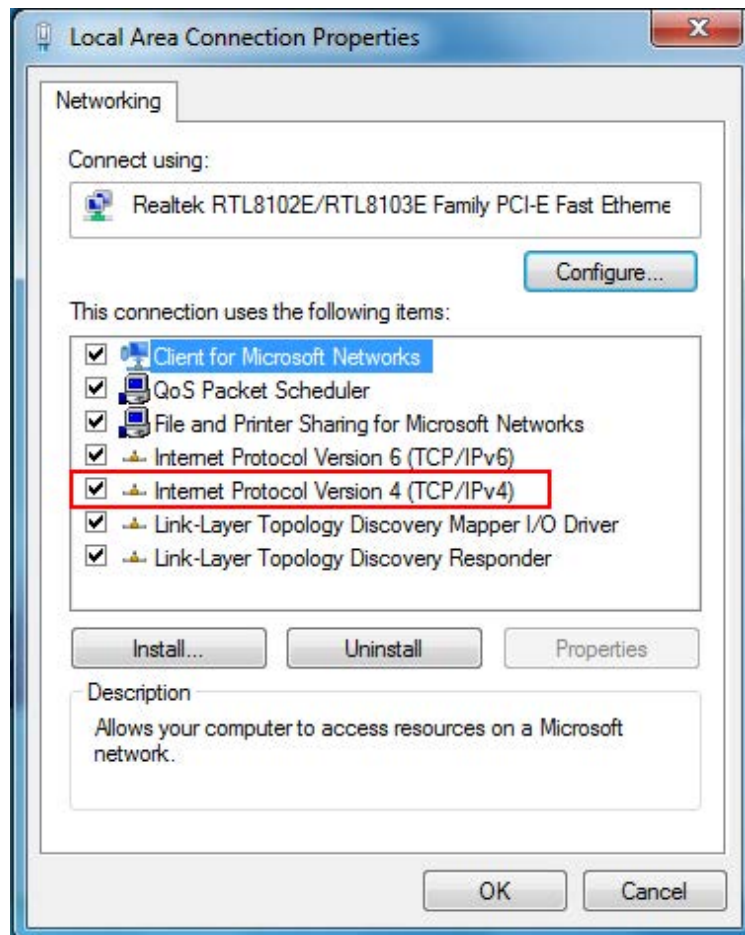

- 3) Click the [Change adapter settings](#).

- 4) Click the right button, and Select [Properties](#).

- 5) In the prompt page that showed below, double click on the [Internet Protocol Version 4 \(TCP/IPv4\)](#).

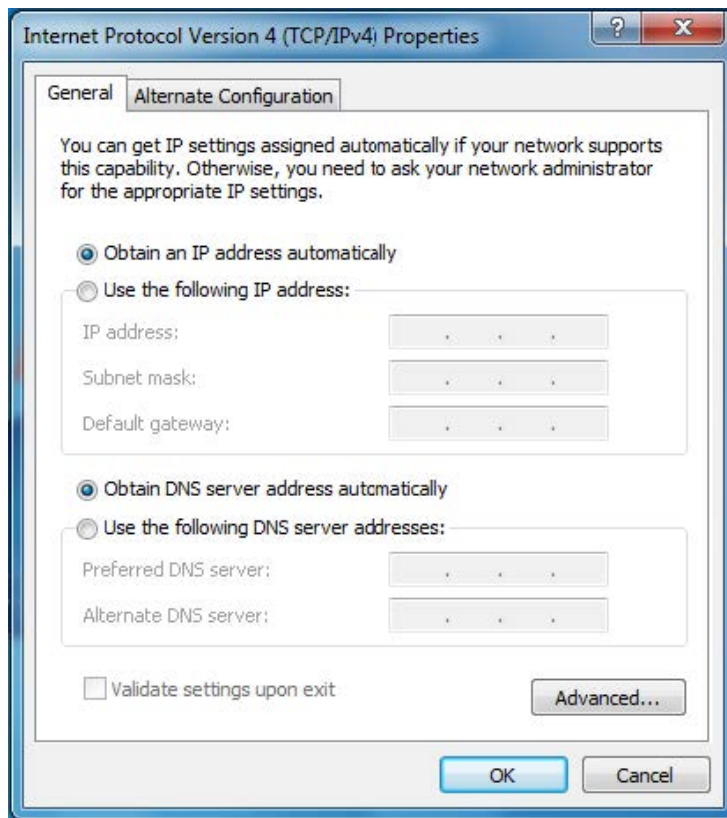

- 6) The following [Internet Protocol Version 4 \(TCP/IPv4\) Properties](#) window will display and the [IP Address](#) tab is open on this window by default.

You have two ways to configure the [TCP/IP](#) protocol below:

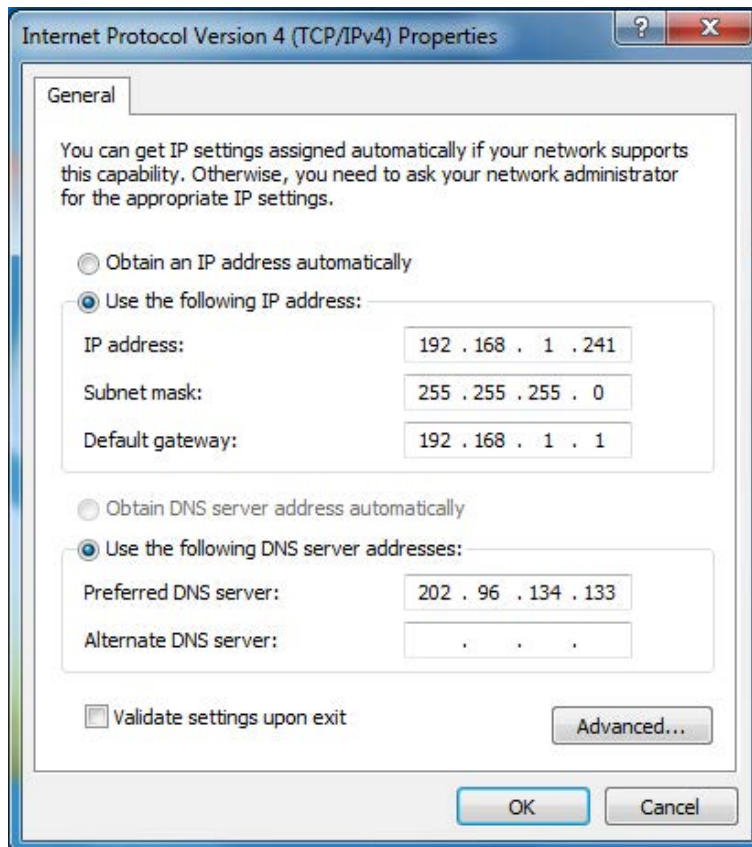

➤ [Setting IP address automatically](#)

Select [Obtain an IP address automatically](#), Choose [Obtain DNS server address automatically](#), as shown in the Figure below:

➤ **Setting IP address manually**

- 1 Select **Use the following IP address** radio button. And the following items available.
- 2 If the Device's LAN IP address is 192.168.1.1, type IP address is 192.168.1.x (x is from 2 to 254), and **Subnet mask** is 255.255.255.0.
- 3 Type the Device's LAN IP address (the default IP is 192.168.1.1) into the **Default gateway** field.
- 4 Select **Use the following DNS server addresses** radio button. In the **Preferred DNS Server** field you can type the DNS server IP address, which has been provided by your ISP.

7) Now click **OK** to keep your settings.
