

Quick Setup Guide

for Standalone Omada Access Points

EAP110 / EAP115 / EAP225 / EAP245 / EAP320 / EAP330 / EAP115-Wall

EAP110-Outdoor / EAP225-Outdoor / EAP225-Wall

1910012420 REV1.0.1

May 2018

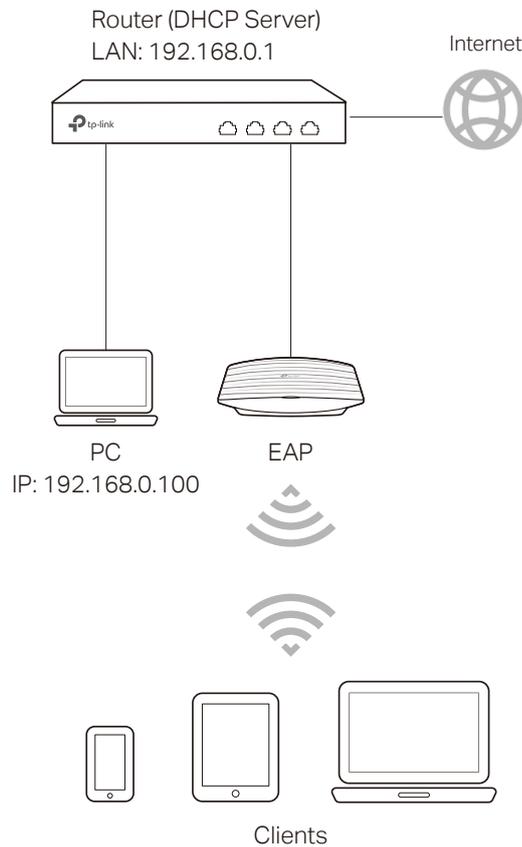

Omada EAP products provide wireless coverage solutions for small-medium business and households. There are two methods to login to manage your EAPs:

- To configure and manage mass EAPs (usually more than three), you can use EAP controller. For detailed instructions about how to use EAP Controller, visit <http://www.tp-link.com/en/download/EAP-Controller.html> to download EAP Controller and its User Guide.
- To configure a few EAPs (usually less than three), you can directly use the management interface of each EAP via a web browser. In such situation, the EAP is in standalone mode.

 This article introduces how to build a wireless network using a standalone EAP. Follow the steps below:

Step1: Connecting the EAP Device to the network

Refer to the following topology and connect the EAP device to your network.

1. Connect your PC and EAP to the LAN ports of your router with Ethernet cables.
2. Set your router to make sure that the PC and EAP can get dynamic IP addresses from the router and surf the internet.

Step2: Logging In to the EAP Device

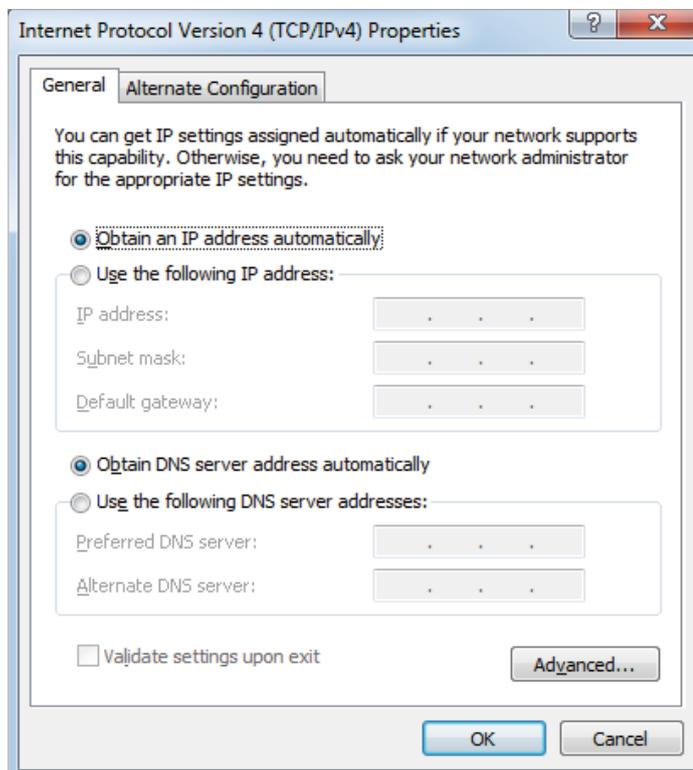

There are two methods to log in to the EAP. You can choose one as you like: *Method 1: Log In via the Domain Name* and *Method 2: Log in via the IP Address of the EAP*.

 **Note:** EAP320 and EAP330 are not currently available for login via domain name.

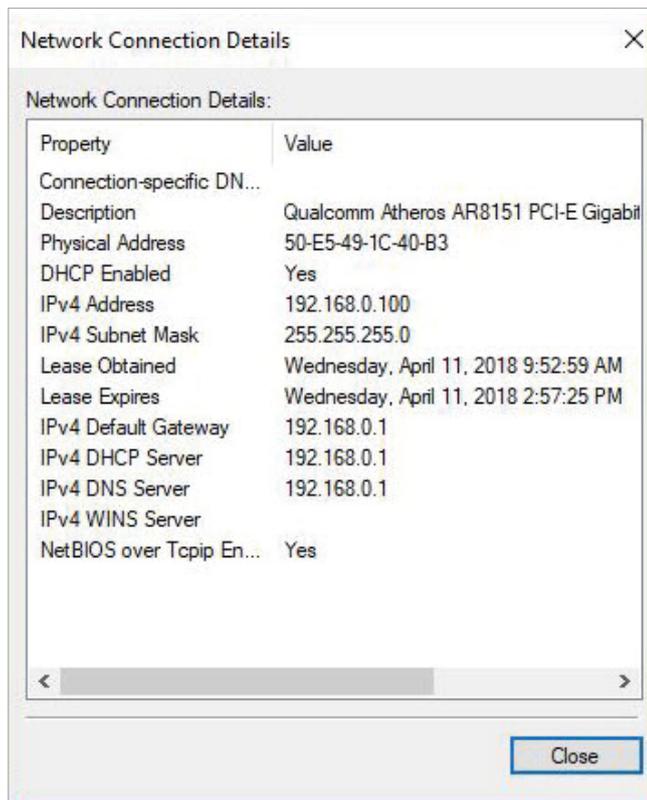

■ Method 1: Log In via the Domain Name

In this method, you needn't know the IP address of the EAP, but you need to prepare a wireless client device, such as a wireless laptop. Follow the steps below to log in to the EAP wirelessly:

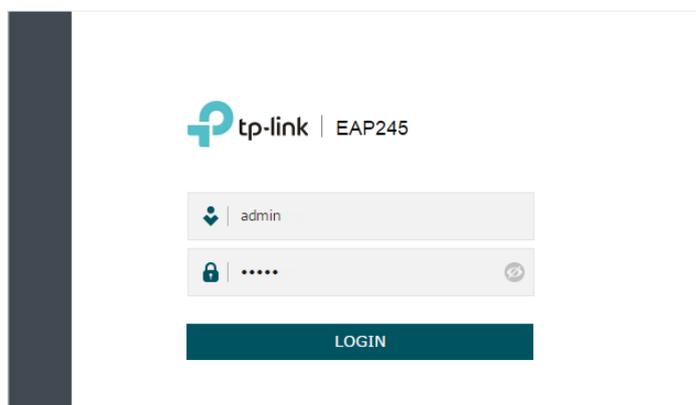

1. Set the wireless client device to get IP settings assigned automatically.

2. Search the default SSID (Network name) using your wireless client device and connect to the wireless network of the EAP. The default SSID of the EAP is printed on the product label at the bottom of the device. The dual-band EAP has two default SSIDs named **TP-LINK_2.4GHz_XXXXXX** and **TP-LINK_5GHz_XXXXXX** on the 2.4GHz band and 5GHz band, and the single-band EAP has a default SSID named **TP-LINK_2.4GHz_XXXXXX** on the 2.4GHz band.
3. Make sure that the wireless client has been assigned with the IP address and has got the IP address of the DNS server and the gateway.

4. Launch a web browser on the client device and enter **http://tplinkeap.net** in the address bar to load the login page of the EAP. Use **admin** for both of the username and password to log in.

Tips:

If you cannot log in to the EAP via the domain name, try the operations below for troubleshooting:

- Clear the browser cache or use another browser to log in again.
- Go to the wireless setting of your wireless client device and turn off the Wi-Fi button. Then turn it on and connect the network again. Or you can reboot the EAP device.
- If you know the IP address of the EAP, you can login to the EAP via the IP address. For the detailed steps, refer to [Method 2: Log in via the IP Address of the EAP](#)

- If login still fails, reset the EAP device to its factory default settings and try again.
5. In the pop-up window, configure a new username and a new password for your user account.

Set up a new username and password

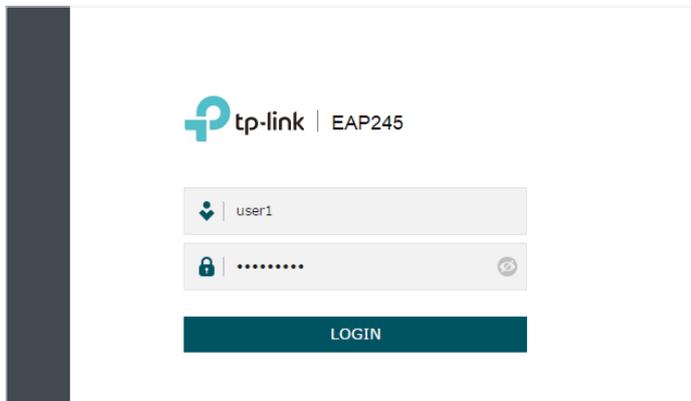

New Username: user1

New Password:
Low Middle High

Confirm Password: ✓

Confirm

6. Use the new username and password to log in.

■ Method 2: Log in via the IP Address of the EAP

To log in to the EAP via the IP address of the EAP, you need to prepare an Ethernet cable to connect your computer. Follow the steps below to log in via the IP address of the EAP:

1. Get the IP address of the EAP. There are two methods.
 - Log in to the router which acts as the DHCP server. In the DHCP client list, find the IP address of your EAP according to its MAC address. The MAC address can be found at the bottom of the EAP.
 - Go to http://www.tp-link.com/en/download/EAP-Controller.html#EAP_Discovery_Tool to download EAP Discovery Utility. EAP Discovery Utility is a software that can scan all EAPs in the same network segment. Install and launch EAP Discovery Utility

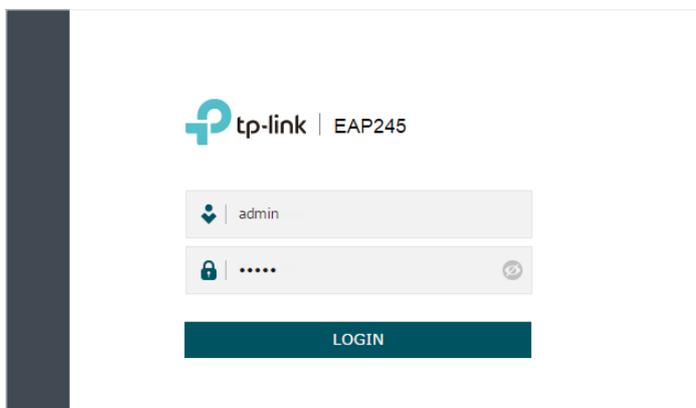

on the PC, and find the IP address of the EAP. In the following figure, the IP address of the EAP is **192.168.0.5**.

The screenshot shows a web interface for discovering EAP devices. At the top, there is a search bar with the text 'MAC, IP, Status'. Below it is a table with the following columns: Select, MAC Address, IP Address, Model, Version, Status, and Action. The table contains one row with the following data: Select (checkbox), MAC Address (50:c7:bf:17:a6:e2), IP Address (192.168.0.5), Model (EAP245), Version (1.0.1 Build 20170414 R...), Status (Pending), and Action (Manage button). Below the table, it says 'Displayed EAP : 1' and there are two buttons: 'Select All' and 'Batch Setting'.

Select	MAC Address	IP Address	Model	Version	Status	Action
<input type="checkbox"/>	50:c7:bf:17:a6:e2	192.168.0.5	EAP245	1.0.1 Build 20170414 R...	Pending	Manage

2. Launch a web browser and enter **192.168.0.5** in the address bar to load the login page of the EAP. Use **admin** for both of the username and password to log in.

3. In the pop-up window, configure a new username and a new password for your user account.

Set up a new username and password

New Username: user1

New Password:
Low Middle High

Confirm Password: ✓

Confirm

4. Use the new username and password to log in.

LOGIN

Tips:

The EAP is preset with a default IP 192.168.0.254, which you can use to log in to its web management page. Follow the steps below:

1. Connect the EAP to your computer with an Ethernet Cable.
2. Assign a static IP address 192.168.0.X (X ranges between 2 and 253) together with the subnet mask 255.255.255.0 to your computer.
3. Open a web browser and enter **192.168.0.254** in the address bar to load the login page of the EAP.
4. Refer to [Step3: Configuring the EAP Device](#) to configure the SSID and password. You can surf the internet after connecting your EAP to a LAN port of the router.

Step3: Configuring the EAP Device

After logging in to the EAP, we recommend that you change the SSID configuration immediately for secure management purpose.

Follow the steps below to add a new SSID:

1. Go to the **Wireless > Wireless Settings** page. If your EAP is a dual-band device, click **2.4GHz** or **5GHz** to choose a frequency band on which the new SSID will be created. In the **SSIDs** section, click **+ Add** to create a new SSID on the chosen band.

Wireless Basic Settings

2.4GHz Wireless Radio: Enable

Wireless Mode: 802.11b/g/n mixed

Channel Width: 20/40MHz

Channel: Auto

Tx Power(EIRP): 19 dBm(10-19)

Note:
The EIRP transmit power includes the antenna gain.

SSIDs

ID	SSID	Wireless VLAN ID	SSID Broadcast	Security Mode	Portal	SSID Isolation	Modify
1	TP-LINK_2.4GHz_17A6E2	0	Enable	None	Disable	Disable	

2. Set a network name and select the security mode. For security, we recommend that you choose **WPA-PSK** and customize your own password. You can keep other parameters as default. Click **OK**.

SSIDs + Add

ID	SSID	Wireless VLAN ID	SSID Broadcast	Security Mode	Portal	SSID Isolation	Modify
--	--	--	--	--	--	--	--

SSID:

Wireless VLAN ID: (1-4094)

SSID Broadcast: Enable

Security Mode:

Version: Auto WPA-PSK WPA2-PSK

Encryption: Auto TKIP AES

Wireless Password:

Group Key Update Period: seconds (30-8640000. 0 means no update.)

Portal: Enable

SSID Isolation: Enable

 **Note:**

- You can click  in the **Modify** column of the SSID entry to edit the SSID. For network security, we recommend that you delete or edit the default SSIDs. By default, anyone can access the network without authentication because the default SSID has no password.
- The configurations for editing the SSID will take effect immediately. So you should reconnect to the wireless network of the EAP.
- For more detailed configurations, visit <https://www.tp-link.com/us/support/> to download the User Guide of EAP in the download center.

After all the steps above are completed, you can enjoy the internet via the EAP.
