4 Appendix: Default Parameters ........................................................................................................................................4-1
VLAN (Virtual Local Area Network) is a network technique that solves broadcasting issues in local area networks. It is usually applied in the following occasions:

- **To restrict broadcast domain:** VLAN technique divides a big local area network into several VLANs, and all VLAN traffic remains within its VLAN. It reduces the influence of broadcast traffic in Layer 2 network to the whole network.

- **To enhance network security:** Devices from different VLANs cannot achieve Layer 2 communication, and thus users can group and isolate devices to enhance network security.

- **For easier management:** VLANs group devices logically instead of physically, so devices in the same VLAN need not be located in the same place. It eases the management of devices in the same work group but located in different places.
To complete 802.1Q VLAN configuration, follow these steps:

1) Configure the port, including the link type and PVID (Port VLAN ID);

2) Configure the VLAN, including creating a VLAN and adding the configured port to the VLAN.

### 2.1 Using the GUI

#### 2.1.1 Configuring the Port

Choose the menu **VLAN > 802.1Q VLAN > Port Config** to load the following page.

![Figure 2-1 Configuring the Port](image)

Select a port and configure its link type and PVID. Click **Apply** to finish the configuration.
## Managing 802.1Q VLAN

**Link Type**

Select the link type of the port.

- **ACCESS**: The port can only be added to one VLAN and its egress rule is untagged. An access port is usually connected to a terminal device that does not support VLAN, a host for example.
- **TRUNK**: The port can be added to one or more VLANs and its egress rule is tagged. A trunk port is usually connected to an intermediate device, such as a switch or a router, to carry traffic in different VLANs.
- **GENERAL**: The port can be a tagged or untagged member of one or more VLANs. A general port can be connected to an intermediate device or a terminal. You can configure the egress rule on the VLAN > 802.1Q VLAN > VLAN Config page according to the connected device.

**PVID**

The default VLAN ID of the port with the values between 1 and 4094. It is used mainly in the following two ways:

- When the port receives a tagged packet, the switch inserts a VLAN tag to the packet based on the PVID.
- When the port receives a UL packet or a broadcast packet, the switch broadcasts the packet within the default VLAN.

**LAG**

Displays the LAG (Link Aggregation Group) which the port belongs to.

**VLAN**

Check details of the VLAN which the port is in.
2.1.2 Configuring the VLAN

Choose the menu VLAN > 802.1Q VLAN > VLAN Config and click Create to load the following page.

**Figure 2-2 Configuring VLAN**

Follow these steps to configure VLAN:

1) Enter a VLAN ID and a description for identification to create a VLAN.

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Enter a VLAN ID for identification with the values between 2 and 4094.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Give a VLAN description for identification with up to 16 characters.</td>
</tr>
</tbody>
</table>

2) Select the untagged port(s) and the tagged port(s) respectively to add to the created VLAN based on the network topology.

<table>
<thead>
<tr>
<th>Untagged port</th>
<th>The selected ports will forward untagged packets in the target VLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tagged port</td>
<td>The selected ports will forward tagged packets in the target VLAN.</td>
</tr>
</tbody>
</table>
Note:

- An access port can only be added to one VLAN and the egress rule is untagged.
- A trunk port can be added to one or more VLANs and the egress rule is tagged.
- A general port can be added to one or more VLANs and the egress rule of the same port can be different in different VLANs.

3) Click **Apply** to make the settings effective.

## 2.2 Using the CLI

### 2.2.1 Creating a VLAN

Follow these steps to create a VLAN:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>vlan vlan-list</td>
<td>When you enter a new VLAN ID, the switch creates a new VLAN and enters VLAN configuration mode; when you enter an existing VLAN ID, the switch directly enters VLAN configuration mode. &lt;br&gt;<strong>vlan-list</strong>: Specify the ID or the ID list of the VLAN(s) for configuration. The ID ranges from 2 to 4094, for example, 2-3, 5.</td>
</tr>
<tr>
<td>3</td>
<td>name descript</td>
<td>(Optional) Specify a VLAN description for identification. &lt;br&gt;<strong>descript</strong>: The length of the description should be 1 to 16 characters.</td>
</tr>
<tr>
<td>4</td>
<td>show vlan [id vlan-list]</td>
<td>Show the global information of the specified VLAN(s). When no VLAN is specified, this command shows global information of all 802.1Q VLANs. &lt;br&gt;<strong>vlan-list</strong>: Specify the ID or the ID list of the VLAN(s) to show information. The ID ranges from 1 to 4094.</td>
</tr>
<tr>
<td>5</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>6</td>
<td>copy running-config startup-config</td>
<td>Save the settings in the configuration file.</td>
</tr>
</tbody>
</table>

The following example shows how to create VLAN 2 and name it as RD:

**Switch#configure**

**Switch(config)#vlan 2**
Managing 802.1Q VLAN

```
Switch(config-vlan)#name RD
Switch(config-vlan)#show vlan id 2

VLAN   Name   Status   Ports
------- -------- --------- ---------
   2       RD     active   
```

```
Switch(config-vlan)#end
Switch#copy running-config startup-config
```

### 2.2.2 Configuring the Port

Follow these steps to configure the port:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>`interface [fastEthernet port</td>
<td>range fastEthernet port-list]</td>
</tr>
<tr>
<td></td>
<td>`port</td>
<td>port-list`</td>
</tr>
<tr>
<td>3</td>
<td>`switchport mode { access</td>
<td>trunk</td>
</tr>
<tr>
<td></td>
<td>`access</td>
<td>trunk</td>
</tr>
<tr>
<td></td>
<td>If the port mode is general, use the following command to configure the PVID:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>switchport pvid vlan-id</code></td>
<td><code>vlan-id</code>: The default VLAN ID of the port with the values between 1 and 4094.</td>
</tr>
<tr>
<td>4</td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>5</td>
<td><code>copy running-config startup-config</code></td>
<td>Save the settings in the configuration file.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the port mode of port 1/0/5 as Trunk:

```
Switch#configure
Switch(config)#interface gigabitEthernet 1/0/5
Switch(config-if)#switchport mode trunk
Switch(config-if)#show interface switchport gigabitEthernet 1/0/5
```
Port Gi1/0/5:
PVID: 1
Member in LAG: N/A
Link Type: Trunk
Member in VLAN:

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Name</th>
<th>Egress-rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>System-VLAN</td>
<td>Tagged</td>
</tr>
</tbody>
</table>

Switch(config-if)#end

Switch#copy running-config startup-config

2.2.3 Adding the Port to the Specified VLAN

Follow these steps to add the port to the specified VLAN:

Step 1  configure
Enter global configuration mode.

Step 2  interface [fastEthernet | range fastEthernet | port-list | gigabitEthernet | port-list]
Enter interface configuration mode.

Step 3  switchport access vlan vlan-id
switchport trunk allowed vlan vlan-list
switchport general allowed vlan vlan-list { tagged | untagged }
Add Access/Trunk/General port to the specified VLAN.

Step 4  show interface switchport [fastEthernet | gigabitEthernet | port]
Verify the information of the port.

Step 5  end
Return to privileged EXEC mode.

Step 6  copy running-config startup-config
Save the settings in the configuration file.

The following example shows how to add the trunk port 1/0/5 to VLAN 2:

Switch#configure
Switch(config)#interface gigabitEthernet 1/0/5

Switch(config-if)#switchport general allowed vlan 2

Switch(config-if)#show interface switchport gigabitEthernet 1/0/5
Port Gi1/0/5:
PVID: 1
Member in LAG: N/A
Link Type: Trunk
Member in VLAN:

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Name</th>
<th>Egress-rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>System-VLAN</td>
<td>Untagged</td>
</tr>
<tr>
<td>2</td>
<td>rd</td>
<td>Tagged</td>
</tr>
</tbody>
</table>

Switch(config-if)#end
Switch#copy running-config startup-config
3 Example for Configuring 802.1Q VLAN

3.1 Network Requirements

- Offices of both Department A and Department B in the company are located in different places, and computers in different offices are connected to different switches.
- It is required that computers can communicate with each other in the same department but not with computers in the other department.

3.2 Configuration Scheme

- Divide computers in Department A and Department B into two VLANs respectively so that computers can communicate with each other in the same department but not with computers in the other department.
- Terminal devices like computers usually do not support VLAN tags. Configure the switch ports connected to the computers as Access. Then add the ports to the corresponding VLANs.
- The intermediate link between two switches carries traffic from two VLANs simultaneously. Configure the ports on both ends of the intermediate link as Trunk, and add the ports to both VLANs.
3.3 Network Topology

The figure below shows the network topology. Host A1 and Host A2 are used in Department A, while Host B1 and Host B2 are used in Department B. Switch 1 and Switch 2 are located in two different places. Host A1 and Host B1 are connected to port 1/0/2 and port 1/0/3 on Switch 1 respectively, while Host A2 and Host B2 are connected to port 1/0/6 and port 1/0/7 on Switch 2 respectively. Port 1/0/4 on Switch 1 is connected to port 1/0/8 on Switch 2.

![Network Topology Diagram]

Exampled with T2600G-28TS, the following sections provide configuration procedure in two ways: using the GUI and using the CLI.

3.4 Using the GUI

Note:
The configurations of Switch 1 and Switch 2 are similar. The following introductions take Switch 1 as an example.
1) Choose the menu **VLAN > 802.1Q VLAN > VLAN Port Config** to load the following page. For port 1/0/2 and port 1/0/3, set the link type as **Access**; for port 1/0/4, set the link type as **Trunk**. Then click **Apply**.

*Figure 3-1  Set the Link Type*
2) Choose the menu **VLAN > 802.1Q VLAN > VLAN Config** and click **Create** to load the following page. Create VLAN 10 with the description of Department-A, and add port 1/0/2 and port 1/0/4 to VLAN 10. Then click **Apply**.

**Figure 3-2 Create VLAN 10 for Department A**

![VLAN Configuration Interface]
3) Choose the menu **VLAN > 802.1Q VLAN > VLAN Config** click **Create** to load the following page. Create VLAN 20 with the description of Department-B, and add port 1/0/3 and port 1/0/4 to VLAN 20. Then click **Apply**.

**Figure 3-3  Create VLAN 20 for Department B**

4) Click **Save Config** to make the settings effective.

### 3.5 Using the CLI

#### Note:

The configurations of Switch 1 and Switch 2 are similar. The following introductions take Switch 1 as an example.

1) Create VLAN 10 for Department A, and configure the description as Department-A. Similarly, create VLAN 20 for Department B, and configure the description as Department-B.

```
Switch_1#configure
Switch_1(config)#vlan 10
Switch_1(config-vlan)#name Department-A
Switch_1(config-vlan)#exit
Switch_1(config)#vlan 20
```

---

**Example for Configuring 802.1Q VLAN ▶ 3-5**
2) Set the port mode of port 1/0/2 and 1/0/3 as Access, and then add port 1/0/2 to VLAN 10 and add port 1/0/3 to VLAN 20.

Switch_1(config)#interface gigabitEthernet 1/0/2
Switch_1(config-if)#switchport mode access
Switch_1(config-if)#switchport access vlan 10
Switch_1(config-if)#exit
Switch_1(config)#interface gigabitEthernet 1/0/3
Switch_1(config-if)#switchport mode access
Switch_1(config-if)#switchport access vlan 20
Switch_1(config-if)#exit

3) Set the port mode of port 1/0/4 as Trunk, and then add it to both VLAN 10 and VLAN 20.

Switch_1(config)#interface gigabitEthernet 1/0/4
Switch_1(config-if)#switchport mode trunk
Switch_1(config-if)#switchport trunk allowed vlan 10,20
Switch_1(config-if)#end
Switch_1#copy running-config startup-config

Configuration File

Switch_1#configure
Switch_1(config)#vlan 10
Switch_1(config-vlan)#name Department-A
Switch_1(config-vlan)#exit
Switch_1(config)#vlan 20
Switch_1(config-vlan)#name Department-B
Switch_1(config-vlan)#exit
Switch_1(config)#interface gigabitEthernet 1/0/2
Switch_1(config-if)#switchport mode access
Switch_1(config-if)#switchport access vlan 10
Switch_1(config-if)#exit
Switch_1(config)#interface gigabitEthernet 1/0/3
Switch_1(config-if)#switchport mode access
Switch_1(config-if)#switchport access vlan 20
Switch_1(config-if)#exit
Switch_1(config)#interface gigabitEthernet 1/0/4
Switch_1(config-if)#switchport mode trunk
Switch_1(config-if)#switchport trunk allowed vlan 10,20
Switch_1(config-if)#end
Switch_1#copy running-config startup-config

**Verify the Configurations**

Switch_1#show vlan

<table>
<thead>
<tr>
<th>VLAN</th>
<th>Name</th>
