FCC STATEMENT

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:
1. This device may not cause harmful interference.
2. This device must accept any interference received, including interference that may cause undesired operation.

Any changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment.

Note: The manufacturer is not responsible for any radio or TV interference caused by unauthorized modifications to this equipment. Such modifications could void the user’s authority to operate the equipment.

FCC RF Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. End users must follow the specific operating instructions for satisfying RF exposure compliance. This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter. This equipment has been SAR-evaluated for use in hand. SAR measurements are based on a 5mm spacing from the body and that compliance is achieved at that distance.
**CE Mark Warning**

This is a class B product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

**Canadian Compliance Statement**

This device complies with Industry Canada license-exempt RSS standard(s). Operation is subject to the following two conditions:

(1) This device may not cause interference, and

(2) This device must accept any interference, including interference that may cause undesired operation of the device.

Cet appareil est conforme aux normes CNR exemptes de licence d’Industrie Canada. Le fonctionnement est soumis aux deux conditions suivantes:

(1) cet appareil ne doit pas provoquer d’interférences et

(2) cet appareil doit accepter toute interférence, y compris celles susceptibles de provoquer un fonctionnement non souhaité de l’appareil.

This device has been designed to operate with the antennas listed below, and having a maximum gain of 4 dBi. Antennas not included in this list or having a gain greater than 4 dBi are strictly prohibited for use with this device. The required antenna impedance is 50 ohms.

To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that permitted for successful communication.

**Industry Canada Statement**

Complies with the Canadian ICES-003 Class B specifications.

Cet appareil numérique de la classe B est conforme à la norme NMB-003 du Canada.

This device complies with RSS 210 of Industry Canada. This Class B device meets all the requirements of the Canadian interference-causing equipment regulations.

Cet appareil numérique de la Classe B respecte toutes les exigences du Règlement sur le matériel brouilleur du Canada.

**Korea Warning Statements**

당해 무선설비는 운용중 전파혼신 가능성이 있습니다.

**NCC Notice & BSMI Notice**
注意！

依据低功率电波辐射性电机管理办法

第十二条 纯型式认可合格之低功率射频电机，非经许可，公司、商号或使用者均不得擅自变更频率、加大功率或变更原设计之特性或功能。

第十四条 低功率射频电机之使用不得影响飞航安全及干拢合法通行；经发现有干拢现象时，应聘即停用，并改善至无干拢时方得继续使用。前项合法通信，指依电信规定作业之无线电信。低功率射频电机需忍受合法通信或工业、科学以及医疗用电波辐射性电机设备之干扰。

减少电磁波影响，请妥善使用。

安全咨询及注意事项
● 請使用原裝電源供應器或只能按照本產品注明的電源類型使用本產品。
● 清潔本產品之前請先拔掉電源線。請勿使用液體、噴霧清潔劑或濕布進行清潔。
● 注意防潮，請勿將水或其他液體潑灑到本產品上。
● 插槽與開口供通風使用，以確保本產品的操作可靠並防止過熱，請勿堵塞或覆盖開口。
● 請勿將本產品置於靠近熱源的地方。除非有正常的通風，否則不可放在密閉位置中。
● 請不要私自打開機殼，不要嘗試自行維修本產品，請由授權的專業人士進行此項工作。

Продукт сертифіковано згідно с правилами системи УкрСЕПРО на відповідність вимогам нормативних документів та вимогам, що передбачені чинними законодавчими актами України.

EAC

Safety Information
● When product has power button, the power button is one of the way to shut off the product; when there is no power button, the only way to completely shut off power is to disconnect the product or the power adapter from the power source.
● Don’t disassemble the product, or make repairs yourself. You run the risk of electric shock and voiding the limited warranty. If you need service, please contact us.
● Avoid water and wet locations.

This product can be used in the following countries:

Package Contents

Please verify that all the package contents below are available.

- One TL-WN721N/TL-WN722N Wireless N USB Adapter
- Quick Installation Guide
- One USB cable/cradle
- One Resource CD for TL-WN721N/TL-WN722N, including:
  - TP-LINK Wireless Configuration Utility (TWCU) and Drivers
  - User Guide
  - Other helpful information

Make sure that the above items are contained in the package. If any of the above items are damaged or missing, please contact your distributor.

Conventions

The ‘adapter’ mentioned in this User Guide stands for TL-WN721N/TL-WN721NC/TL-WN722N/TL-WN722NC without any explanation. TL-WN721N, TL-WN721NC, TL-WN722N and TL-WN722NC are sharing this User Guide, and for simplicity, we will take TL-WN722N as an example. The table below shows their similarities and differences.

Chapter 1 Introduction

1.1 Overview of Product

The adapter is an 802.11n client device designed to deliver a high-speed and unrivaled wireless performance for your desktop. With a faster wireless connection, you can get a better Internet experience, such as downloading, gaming, video streaming.

With the 802.11n technology, higher throughput improvements using MIMO (multiple input, multiple output antennas), the TL-WN721N/TL-WN722N's auto-sensing capability allows high packet transfer rate up to 150Mbps for maximum throughput. It has good capability on anti-jamming, and it can also interoperate with other wireless (802.11b/g) products. The adapter supports WEP, WPA and WPA2 encryption to prevent outside intrusion and protect your personal information from being exposed.

The adapter is easy to install and manage with the Quick Setup Wizard guiding you step-by-step through the installation process and the TP-LINK Wireless Configuration Utility instructing you to quickly set up a wireless connection.

With unmatched wireless performance and security protection, TL-WN721N/TL-WN722N is the best choice for easily adding or upgrading wireless connectivity to your desktop.

1.2 Features

- Complies with IEEE802.11n, IEEE802.11g, IEEE802.11b standards
- Supports WPA/WPA2 data security, IEEE802.1x authentication, TKIP/AES encryption, WEP encryption
- Supports maximum throughput rate up to 150Mbps for TL-WN721N/TL-WN722N and it can automatically adjust to lower speeds due to distance or other operating limitations
- Provides USB 2.0 interface
- Supports Ad-Hoc and Infrastructure modes
- Good capability on anti-jamming
- Supports roaming between access points when configured in Infrastructure mode
- Ease to configure and provides monitoring information
- Supports Windows XP, Windows Vista, Windows 7, Windows 8 and Windows 8.1
1.3  Hardware Overview

</tr>
</tbody>
</table>

🔗 Note:
When the Adapter failed to connect to a wireless network, the LED may be off. Please choose your network and try to connect again.
Chapter 2 Installation

2.1 Hardware Installation

There are two ways to install the Adapter:
1. Plug the Adapter directly to the USB port on your computer.
2. Connect the Adapter and your computer through the USB cable/cradle attached in package.

☞ Note:
The Found New Hardware Wizard screen will pop up when the adapter is installed correctly. Click Cancel.

2.2 Software Installation

The adapter’s Setup Wizard will guide you through the installation procedures for Windows XP, Windows Vista, Windows 7, Windows 8 and Windows 8.1. The procedures in different systems are quite similar, therefore here we use the procedures in Windows 7 as an example.

1. Insert the Resource CD into your CD-ROM drive, and the window below will appear. Select model TL-WN722N. There will be a menu including: Install Driver and Utility and User Guide. Click Install Driver and Utility to begin.
2. The InstallShield Wizard window will appear. Click Next to continue.

![InstallShield Wizard]

3. Choose a setup type. It is recommended to select Install TP-LINK Wireless Configuration Utility and Driver. Selecting Install Driver Only will only install driver. Click Next to continue.

![Setup Type]

Figure 2-2

Figure 2-3
4. Click **Change**... to specify the destination location for the software or you can leave it default. Click **Next** in the screen below to continue.

![Figure 2-4](image)

5. Click **Install** to continue the setup.

![Figure 2-5](image)
6. The installation process will take 1 to 2 minutes.

![Figure 2-6](image)

**Figure 2-6**

7. After all the steps above, you will see the screen below. Click Finish to complete the setup.

![Figure 2-7](image)

**Figure 2-7**
8. After installation, the utility configuration page will automatically pop up as shown in the following figure and the icon will appear in your system tray. To connect to a network, please refer to Chapter 3 Connect to a Wireless Network.

![Figure 2-8](image-url)
Chapter 3 Connect to a Wireless Network

With both the hardware and software successfully installed into your computer, you can quickly connect to a wireless network using one of the following methods.

- **Method One:**

  To connect using TWCU (TP-LINK Wireless Configuration Utility)

  TL-WN721N/TL-WN722N uses the TP-LINK Wireless Configuration Utility as the management software. The utility provides you an easy interface to connect to a network and to change any settings related to the wireless adapter.

- **Method Two:**

  To connect using WPS

  By this method, you can connect to your network quickly on the condition that your router or access point supports WPS/QSS.

- **Method Three:**

  To connect using Windows built-in wireless utility

  Windows users may use the built-in wireless utility to connect to a wireless network. For specific operations, please go to To connect using Windows built-in wireless utility.

3.1 To connect using TWCU

1. After installation, the utility configuration page will automatically pop up on the screen. If the utility page does not pop up, you can also launch the utility by double-clicking on the icon on your desktop or the icon in your system tray.
2. The **Network** page will display all wireless networks that are available in your area. To connect to a network, simply highlight the wireless network name (SSID) and click **Connect**. If you tick **Connect automatically**, the adapter will automatically connect to your target network next time.

![Network page](image)

**Figure 3-2**

3. You will be prompted different windows when you choose wireless network of different security types.

1) **Wireless network of WPA/WPA2-Personal**

If you selected a wireless network of the security type WPA/WPA2-Personal, you will be prompted to enter the password in the security key field, as shown in Figure 3-3. Or you can push the **WPS/QSS** button on your Router (if it features the WPS/QSS function) to quickly build a connection without entering the security key (password).

![Password input](image)

**Figure 3-3**
Note:
The security key (password) can be found on the configuration page of your Router or Access Point.

2) Wireless network of **WPA/WPA2-Enterprise**
If you selected a wireless network of the security type WPA/WPA2-Enterprise, you will be prompted to choose a type of authentication, either **Certificate** or **Password**. With **Certificate** as your authentication, you need to select one specific certificate from the drop-down list, as shown in Figure 3-4. With **Password** as your authentication, you should enter the right user name and password in the corresponding field, as shown in Figure 3-5.

3) Wireless network of **None**
If you selected a wireless network of **None** (that is, no security is set.), you can get directly connected to this network without any further configuration.
4. Please wait a few minutes for the connection process.

![Connecting to TP-Link Network](image)

**Figure 3-6**

5. You have now successfully connected to your network. Click **Close** to enjoy the Internet.

![Connected to TP-Link Network](image)

**Figure 3-7**
6. To view more information about the network currently connected, click Status in the tools section and the page will display information such as the network type, link quality and wireless mode.

![Image of TP-Link User Interface](image)

**Profile Name:** TP-LINK_Network1  
**Network Name (SSID):** TP-LINK_Network1  
**Network Type:** Infrastructure  
**Rate:** 150Mbps  
**Channel:** 1 (2.4GHz)  
**Encryption Type:** AES  
**AP MAC:** 94:0C:60:2F:3C:BE  
**Wireless Mode:** 802.11n  
**IP Address:** 192.168.1.103  
**Signal Strength:** (0% - 100% Excellent)

**Figure 3-8**

### 3.2 To connect using WPS

WPS (Wi-Fi Protected Setup) function allows you to add a new wireless device to an existing network quickly.

If the wireless router supports WPS/QSS, you can establish a wireless connection between the Adapter and router using either Push Button Configuration (PBC) method or PIN method.

#### 3.2.1 PBC (Push Button Configuration) method

1. Press the **WPS/RESET** button for 2~3 seconds on the back panel of the router. Here we use router TL-WR841ND as an example.

![Image of TP-Link Wireless N Router](image)

2. Press the WPS button on the adapter. There are two ways:
   - Method One:
Press and hold the WPS button on the adapter directly for 2~3 seconds until Figure 3-11 appears.

Figure 3-9

- Method Two:
  Open TWCU and click WPS tab. Select **Push the button on my access point or wireless router** and then click **Connect**.

![Figure 3-10]

3. The adapter will be connecting to the target network.

![Figure 3-11]
4. When the following window appears, you have successfully connected to the network.

![Successful Network Connection](image)

Figure 3-12

3.2.2 PIN method

There are two ways to configure the WPS by PIN method:

1) Enter the PIN from your AP device.
2) Enter a PIN into your AP device.

**Note:**
The second method is only available in Windows XP and Windows Vista. Following are detailed configuration procedures of each way.

**3.2.2.1. Enter the PIN from your AP device**

1. Open **TWCU** and click **WPS** tab. Select **Enter the PIN of my access point or wireless router**. In the empty field beside PIN, enter the PIN labeled on the bottom of the router (here we use 13492564 as an example). If you have generated a new PIN code for your router, please enter the new one instead. Click **Connect** to continue.

![WPS Configuration](image)

Figure 3-13
2. The adapter will be connecting to the target network.

![Configuring the wireless network](image)

**Figure 3-14**

3. When Figure 3-12 appears, you have successfully connected to the network.

3.2.2.2. Enter a PIN into your AP device

**Note**

This method is only available in Windows XP and Windows Vista.

1. Open **TWCU** and click **WPS** tab. Select **Enter the PIN of this device into my access point or wireless router**. In the field beside PIN, you will see the PIN value of the adapter which is randomly generated. Click **Connect** to continue.

![WPS configuration](image)

**Figure 3-15**
2. Open your router’s Web-based Utility and click WPS link on the left of the main menu. Then click **Add device** and the following figure will appear. Enter the PIN value of the adapter in the empty field beside PIN and then click **Connect**.

![Figure 3-16](image)

3. When **Connect successfully** appears on the screen, the WPS configuration is completed. Or you can view the adapter’s utility page to see whether the connection has been successful as shown in Figure 3-18.

![Figure 3-17](image)

![Figure 3-18](image)
3.3 To connect using Windows built-in wireless utility

3.3.1 In Windows 7

Windows 7 users may use the built-in wireless utility. Follow the steps below.
1. Left-click the wireless icon in your system tray (lower-right corner). The utility will display any available wireless networks in your area. Highlight the wireless network (displayed using the SSID) to be connected and then click Connect.

![Image showing network selection and connection](image-url)
2. If the network you would like to connect is security-enabled, enter the same security key or passphrase that is on your router. Or push the WPS/QSS button (other brands may call it WPS) on the router or access point (You will be prompted to push the button on the window if QSS function is supported as shown in the figure below). If the network to be connected is not secure, the connection will be built without entering a key.

![Figure 3-20](image)

3. You have now successfully connected to the network.

![Figure 3-21](image)
3.3.2 In Windows Vista

Windows Vista users may use the built-in wireless utility. Follow the steps below.

1. Open the wireless utility by right-clicking on the wireless computer icon in your system tray as shown in the figure below. Select **Connect to a network**.

![Figure 3-22](image)

2. The utility will display any available wireless networks in your area. Highlight the wireless network you would like to connect and then click **Connect**.

![Figure 3-23](image)
3. If the network you would like to connect is security-enabled, enter the same security key or passphrase that is on your router. If the network to be connected is not secure, the connection will be built without entering a key.

![Figure 3-24](image)

4. You have now successfully connected to the network.

![Figure 3-25](image)

3.3.3 In Windows XP

Windows XP users may use the built-in wireless utility. Follow the steps below.
1. Right-click on the utility icon in your system tray (lower-right corner). Select **Switch to Windows wireless configuration tool**.

Or double-click the utility icon to load the utility configuration page. Click **Advanced** in the tools section and then select **Use Windows wireless configuration tool** in the figure shown below. Click **OK** when Figure 3-28 appears to continue.
2. Right-click on the wireless computer icon in your system tray (lower-right corner). Select **View Available Wireless Networks**.

![View Available Wireless Networks](image1.png)

**Figure 3-29**

3. The utility will display any available wireless networks in your area. Click on a network (displayed using the SSID) and click the **Connect** button.

![Connect](image2.png)

**Figure 3-30**

4. If the network is security-enabled, you will be prompted to enter the key as shown below. If not, you will connect to the network directly without entering a key.

![Wireless Network Connection](image3.png)

**Figure 3-31**

### 3.3.4 In Windows 8

Windows 8 users may use the built-in wireless utility. Follow the steps below.
1. Click the icon at the bottom of your screen, and a network list will appear at the right side of your screen. Select your target network, and then click Connect.

![Networks](image)

Figure 3-32

2. If the network is unencrypted, you will directly connect to it.

If the network is encrypted, enter the password (network security key) and then click Next to continue.

![Networks](image)

Figure 3-33

_Note:_
You can also push the WPS/QSS button on your router as hinted “You can also connect by pushing the button on the router”. Then click Next to continue.
3. When Connected appears behind the SSID (as shown below), you have successfully connected to the target network.

![Networks](image)

**Figure 3-34**

**Note:**

If the adapter is connected to the network for the first time, you will be asked whether to turn on sharing or connect to devices. Please select “Yes, ...” or “No, ...” according to your Internet environment.

![Networks](image)

**Figure 3-35**

### 3.3.5 In Windows 8.1

Windows 8.1 users may use the built-in wireless utility. Follow the steps below.
1. Click the icon at the bottom of the computer screen. A network list will appear at the right side. Select your target network, and click **Connect**.

![Networks](image)

Figure 3-36

2. If the network is unencrypted, you will directly connect to it.

If the network is encrypted, enter the password (network security key) and click **Next** to continue.

![Networks](image)

Figure 3-37

**Note:**

You can also push the WPS/QSS button on your router as hinted “You can also connect by pushing the button on the router”. Then click **Next** to continue.
3. When **Connected** appears behind the SSID (as shown below), you have successfully connected to the target network.

![Networks](image)

**Note:**
If it is the first time the adapter is connected to the network, you will be asked the following question. Choose according to your Internet environment.

![Networks](image)

Do you want to find PCs, devices, and content on this network, and automatically connect to devices like printers and TVs?

We recommend that you do this on your home and work networks.

![Networks](image)
Chapter 4 Management

This section will show you how to configure your TL-WN722N adapter using the TP-LINK Wireless Configuration Utility (TWCU).

The TL-WN722N adapter uses the TP-LINK Wireless Configuration Utility as the management software. The utility provides users with an easy interface to change any settings related to the adapter. Double-clicking on the icon on your desktop will start the utility.

4.1 Profile

Your wireless networks may vary in different places like home, office or coffee shop. With Profile management, you can easily save and manage various networks to be connected, saving you the trouble of having to repeat the same configurations. Click Profile in the tools section, the following page will appear.

![Figure 4-1](image-url)
4.1.1 Add a profile

To add a profile, click the Add button on the bottom of the screen. Then the configuration window will appear.

![Configuration window](image)

**Profile Name:** Enter a name for your profile (e.g. Home, Office, CoffeeShop). The same name is not allowed. Please also note that no space is allowed between words.

**SSID:** Select the target network from the drop-down list.

**Network Type:** Select the network type. If you are connecting to a wireless router or access point, select **Infrastructure**. If you are connecting to another wireless client such as an adapter, select **ad-hoc**.

**Security Type:** Select the security type from the list. Three options are available: **WPA-PSK/WPA2-PSK**, **WEP**, and **None**. The security type should be the same as on your router or access point, otherwise, you will not be able to build a successful connection.

**WPA-PSK/WPA2-PSK** uses a passphrase or key to authenticate your wireless connection. The key must be the exact same key entered on your wireless router or access point.
None stands for no security. It is recommended to enable WPA-PSK/WPA2-PSK on your wireless router or access point before configuring your wireless adapter.

Note:
You will see Figure 4-2 if you selected the security type WPA-PSK/WPA2-PSK; while, if you selected the security type WPA/WPA2 (-Enterprise), Figure 4-3 will be displayed.

- Encryption Type: From the drop-down menu, select the encryption type that is the same as on your router or access point.
- Security Key: Enter the passphrase exactly as it is on your wireless router or access point. Click the Show characters box to see the passphrase. Unchecking it will hide it.
- Start this connection automatically: check this box to automatically connect to this network next time.
- Save: Click Save to save your settings.

Having completed the above settings, the Profile page should look like the following figure. To connect to a desired network, just highlight the network you would like to connect to and click the Connect button on the bottom of the window.

![Profile Page Screenshot]

Figure 4-4
4.1.2 Modify a profile

You may edit an existing profile by clicking the Modify button from the Profile page. For instance, you may like to change the profile name from Home to Home1 or you may want to specify another SSID for profile Home. After all the changes, click Save to make the changes take effect.

![Profile page](image)

**Figure 4-5**

4.1.3 Delete a profile

To delete an existing profile, highlight the profile name and click Remove on the bottom of the screen or press the Delete button on your keyboard. When the following figure appears, click OK to continue.

![Delete confirmation](image)

**Figure 4-6**

4.2 Advanced

The following configurations can be made on the Advanced page:

1) To select wireless configuration tool.

   Here you can decide which tool to use, either the TP-LINK Configuration Utility or the Windows wireless configuration tool. *(This option is available only in Windows XP.)*

2) To switch to another wireless network adapter.
Here you can switch to another adapter installed in your computer. The adapters successfully installed in your computer will be listed in the drop-down menu if the adapters are supported by this utility.

3) To switch to Soft AP mode.
   Once enabled, the adapter will be able to work as an AP.

   **Note:**
   This option is only available in Windows 7 and Windows 8.

4) To change the power save mode.

![Figure 4-7](image)

### 4.3 About

The About screen gives you information about the Driver and Utility versions of the adapter. Right-click on the 💻 icon in your system tray and select **About** from the list.

![Figure 4-8](image)
Figure 4-9
Chapter 5  AP Mode

Note:
This function is available only in Windows 7 and Windows 8.

In Soft AP mode, the adapter will work as an AP.

Suppose that only one computer in your house can access the Internet for various reasons like only one WLAN port is available on your wired broadband router, however, other wireless-capable devices also want to share the Internet. Then the adapter can be configured as an AP under the Soft AP mode, saving you the trouble of having to get a separate access point or a router.

With this feature, a computer can use a single physical wireless adapter to connect as a client to a hardware access point while at the same time acting as a software AP allowing other wireless-capable devices to connect to it.

To switch to this mode, right-click on the utility icon in your system tray and select Switch to Soft AP mode.

![Figure 5-1](image)

Or from the Advanced page of the utility, tick ON under the Soft AP mode as shown in the following figure. Click OK when prompted to confirm the setting.

![Figure 5-2](image)
The **Soft AP** icon should then appear beside **Advanced** icon in the utility.

![Soft AP icon](image)

**Figure 5-3**

- **Soft AP mode**: Select to enable or disable the function.
- **Internet Connecting Share(ICS)**: Specify a connection through which devices connected to your AP can access the Internet.
- **SSID**: Enter the name for your soft AP (for example, Jone) so that others can know which AP is yours when trying to connect to it. The default name (SSID) is “tp-link”.
- **Security Type**: The security type here is set to be WPA2-PSK which is based on 802.11i and uses Advanced Encryption Standard instead of TKIP. It was designed to improve the security features of WEP. WPA2-PSK uses a passphrase or key to authenticate your wireless connection. You needn’t make any configuration here.
- **Encryption Type**: The encryption type here is set to be AES.
- **Security Key**: Enter the Key in the field to make your AP security enabled. It is recommended that you specify another key instead of the default key 12345678. Only by entering the corresponding key can other computers establish a successful connection with your AP.
- **IP Address**: Here displays the IP address of the Soft AP.
Chapter 6 Uninstall Software

6.1 In Windows XP/Vista/7

6.1.1 Uninstall the utility software from your PC

1. On the Windows taskbar, click the Start button, click All programs→TP-LINK, and then click Uninstall-TP-LINK Wireless Configuration Utility.

2. Follow the Install Shield Wizard to uninstall the utility software from your PC.
3. Click **Finish** when the figure below appears.

![Figure 6-3](image)

**Figure 6-3**

### 6.1.2 Uninstall the driver software from your PC

1. On the Windows taskbar, click the **Start** button, click **All programs**→**TP-LINK**, and then click **Uninstall- TP-LINK TL-WN721N_TL-WN722N Driver**.

![Figure 6-4 Uninstall Driver](image)
2. Following the steps, then the system will uninstall the driver software of the adapter from your PC.

6.2 In Windows 8

6.2.1 Uninstall the utility software from your PC

1. Enter the Metro interface, right-click any blank place in the Metro interface, then App Bar will appear below the Metro interface, click All apps. Find the TP-LINK application, and click Uninstall- TP-LINK Wireless Configuration Utility.

2. Click Yes to start uninstalling the utility software from your PC.
3. It may take a few minutes to undergo the whole un-installation process.

![Figure 6-7](image1)

**Figure 6-7**

4. Click **Finish** when the figure below appears.

![Figure 6-8](image2)

**Figure 6-8**
6.2.2 Uninstall the driver software from your PC

1. Enter the Metro interface, right-click any blank place in the Metro interface, then App Bar will appear below the Metro interface, click All apps. Find the TP-LINK application, and click Uninstall- TP-LINK TL-WN721N_TL-WN722N Driver.

![Apps](image)

Figure 6-9

2. Click Yes to start uninstalling the driver software from your PC.

![Uninstall Window](image)

Figure 6-10
3. It may take a few minutes to undergo the whole un-installation process.

4. Click **Finish** when the figure below appears.
6.3 In Windows 8.1

6.3.1 Uninstall the driver software from your PC

1. Enter the Metro interface, click the icon at the lower left part of the screen, and All apps will be shown on the screen. Find the TP-LINK application, and click Uninstall-TP-LINK TL-WN721N_TL-WN722N Driver.

![Apps]

Figure 6-13

2. Click Yes to start uninstalling the driver software from your PC.

![Uninstall confirmation]

Figure 6-14
3. It may take a few seconds to undergo the whole un-installation process.

* Only 2.412GHz~2.462GHz is allowed to be used in USA, which means only channel 1~11 is available for American users to choose.
Appendix B: Glossary

- **802.11b** - The 802.11b standard specifies a wireless product networking at 11 Mbps using direct-sequence spread-spectrum (DSSS) technology and operating in the unlicensed radio spectrum at 2.4GHz, and WEP encryption for security. 802.11b networks are also referred to as Wi-Fi networks.

- **802.11g** - specification for wireless networking at 54 Mbps using direct-sequence spread-spectrum (DSSS) technology, using OFDM modulation and operating in the unlicensed radio spectrum at 2.4GHz, and backward compatibility with IEEE 802.11b devices, and WEP encryption for security.

- **802.11n** - 802.11n builds upon previous 802.11 standards by adding MIMO (multiple-input multiple-output). MIMO uses multiple transmitter and receiver antennas to allow for increased data throughput via spatial multiplexing and increased range by exploiting the spatial diversity, perhaps through coding schemes like Alamouti coding. The Enhanced Wireless Consortium (EWC) was formed to help accelerate the IEEE 802.11n development process and promote a technology specification for interoperability of next-generation wireless local area networking (WLAN) products.

- **Ad hoc Network** - An ad hoc network is a group of computers, each with a Wireless Adapter, connected as an independent 802.11 wireless LAN. Ad hoc wireless computers operate on a peer-to-peer basis, communicating directly with each other without the use of an access point. Ad hoc mode is also referred to as an Independent Basic Service Set (IBSS) or as peer-to-peer mode, and is useful at a departmental scale or SOHO operation.

- **DSSS** - (Direct-Sequence Spread Spectrum) - DSSS generates a redundant bit pattern for all data transmitted. This bit pattern is called a chip (or chipping code). Even if one or more bits in the chip are damaged during transmission, statistical techniques embedded in the receiver can recover the original data without the need of retransmission. To an unintended receiver, DSSS appears as low power wideband noise and is rejected (ignored) by most narrowband receivers. However, to an intended receiver (i.e. another wireless LAN endpoint), the DSSS signal is recognized as the only valid signal, and interference is inherently rejected (ignored).

- **FHSS** - (Frequency Hopping Spread Spectrum) - FHSS continuously changes (hops) the carrier frequency of a conventional carrier several times per second according to a pseudo-random set of channels. Because a fixed frequency is not used, and only the transmitter and receiver know the hop patterns, interception of FHSS is extremely difficult.

- **Infrastructure Network** - An infrastructure network is a group of computers or other devices, each with a Wireless Adapter, connected as an 802.11 wireless LAN. In infrastructure mode, the wireless devices communicate with each other and to a wired network by first going through an access point. An infrastructure wireless network connected to a wired network is referred to as a Basic Service Set (BSS). A set of two or more BSS in a single network is referred to as an Extended Service Set (ESS). Infrastructure mode is useful at a corporation scale, or when it is necessary to connect the wired and wireless networks.
- **Spread Spectrum** - Spread Spectrum technology is a wideband radio frequency technique developed by the military for use in reliable, secure, mission-critical communications systems. It is designed to trade off bandwidth efficiency for reliability, integrity, and security. In other words, more bandwidth is consumed than in the case of narrowband transmission, but the trade off produces a signal that is, in effect, louder and thus easier to detect, provided that the receiver knows the parameters of the spread-spectrum signal being broadcast. If a receiver is not tuned to the right frequency, a spread-spectrum signal looks like background noise. There are two main alternatives, Direct Sequence Spread Spectrum (DSSS) and Frequency Hopping Spread Spectrum (FHSS).

- **SSID** - A Service Set Identification is a thirty-two character (maximum) alphanumeric key identifying a wireless local area network. For the wireless devices in a network to communicate with each other, all devices must be configured with the same SSID. This is typically the configuration parameter for a wireless PC card. It corresponds to the ESSID in the wireless Access Point and to the wireless network name. See also Wireless Network Name and ESSID.

- **WEP** - (Wired Equivalent Privacy) - A data privacy mechanism based on a 64-bit or 128-bit or 152-bit shared key algorithm, as described in the IEEE 802.11 standard. To gain access to a WEP network, you must know the key. The key is a string of characters that you create. When using WEP, you must determine the level of encryption. The type of encryption determines the key length. 128-bit encryption requires a longer key than 64-bit encryption. Keys are defined by entering in a string in HEX (hexadecimal - using characters 0-9, A-F) or ASCII (American Standard Code for Information Interchange – alphanumeric characters) format. ASCII format is provided so you can enter a string that is easier to remember. The ASCII string is converted to HEX for use over the network. Four keys can be defined so that you can change keys easily.

- **Wi-Fi** - A trade name for the 802.11b wireless networking standard, given by the Wireless Ethernet Compatibility Alliance (WECA, see http://www.wi-fi.net), an industry standards group promoting interoperability among 802.11b devices.

- **WLAN** - (Wireless Local Area Network) - A group of computers and associated devices communicate with each other wirelessly, which network serving users are limited in a local area.

- **WPA** - (Wi-Fi Protected Access) - A wireless security protocol uses TKIP (Temporal Key Integrity Protocol) encryption, which can be used in conjunction with a RADIUS server.
